

# SHG imaging: From molecules to tissues

朱士維  
台大物理系

# Outline

- Introduction
- Principles of optical harmonics
- Experimental setup
- Applications of harmonics imaging
  - Material science
    - GaN material properties mapping
    - 3D Electric field visualization
  - Biological science
    - Bio-photonic crystal probing
    - Tissue imaging
- Summary

# Optical microscopy

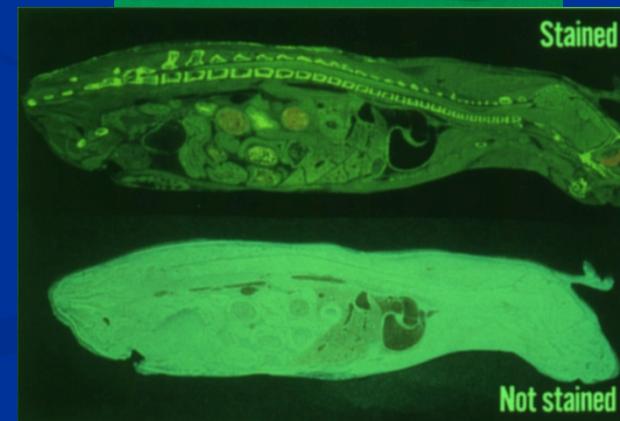

- Important issues
  - Contrast
  - Resolution
  - Penetration depth
  - Noninvasiveness

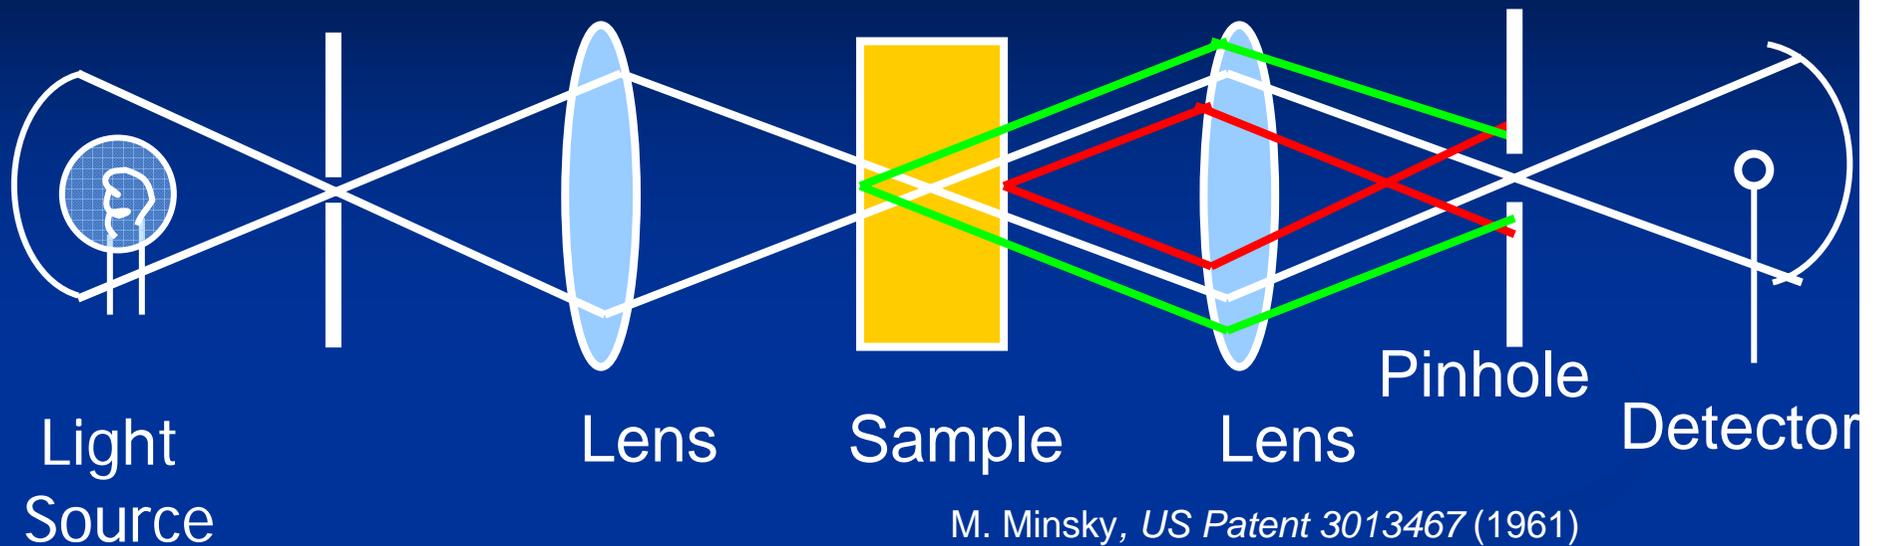

Bright field microscopy

# Advanced microscopy

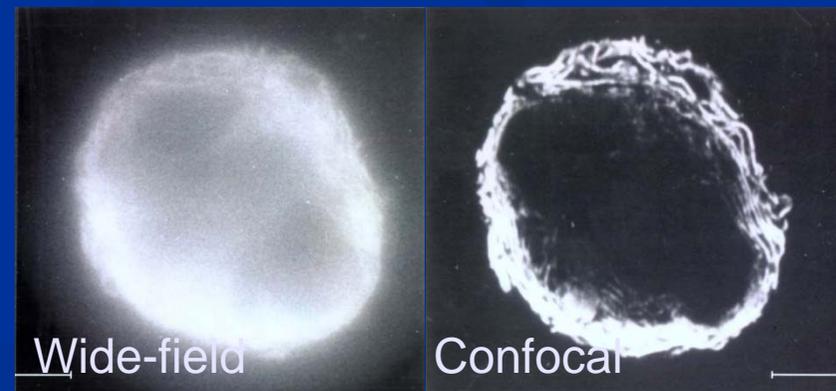

- Dark field microscopy
  - ✓ Contrast enhanced
- DIC or PC microscopy
  - ✓ Contrast enhanced
- Fluorescence microscopy
  - ✓ Contrast enhanced
  - ✗ No deep tissue observation
    - Due to blurring
  - ✗ Staining required

# Confocal microscopy

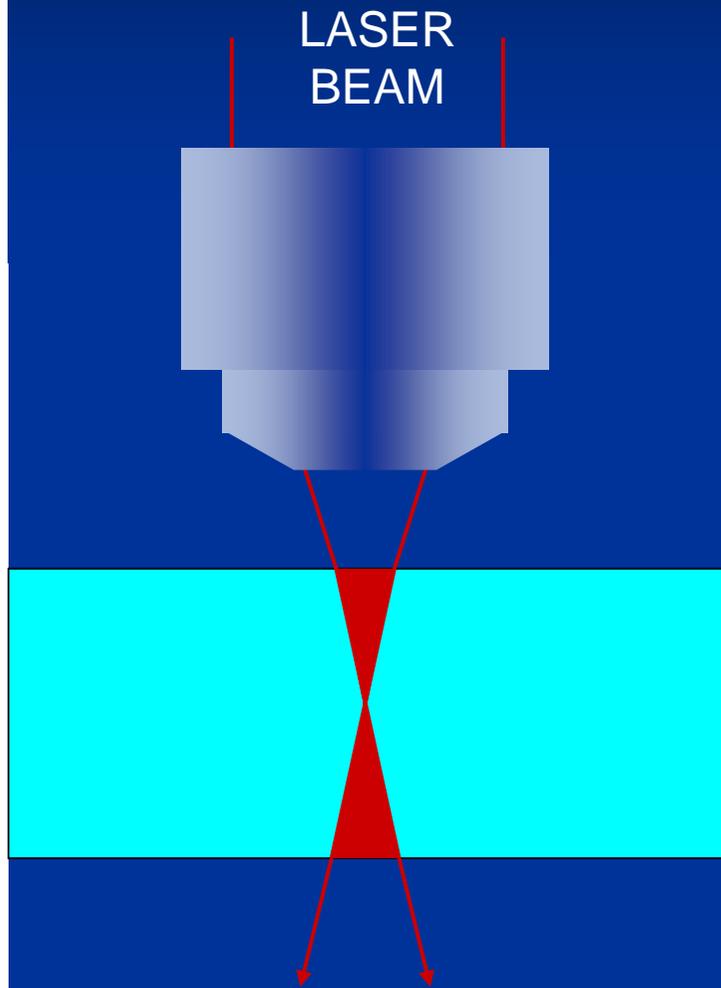

- Contrast enhanced
- Resolution enhanced
  - Due to the rejection of out-of focus light
  - Optical section

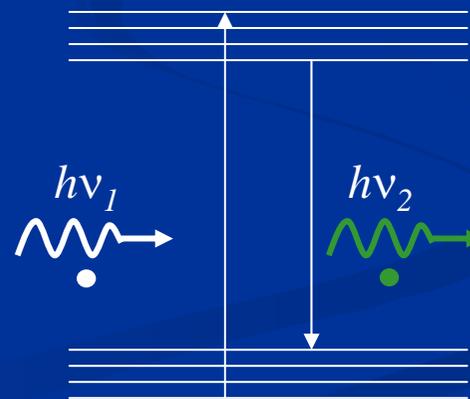

Plasmacytoma cell

*J Cell Biology* 105, p44 (1987)

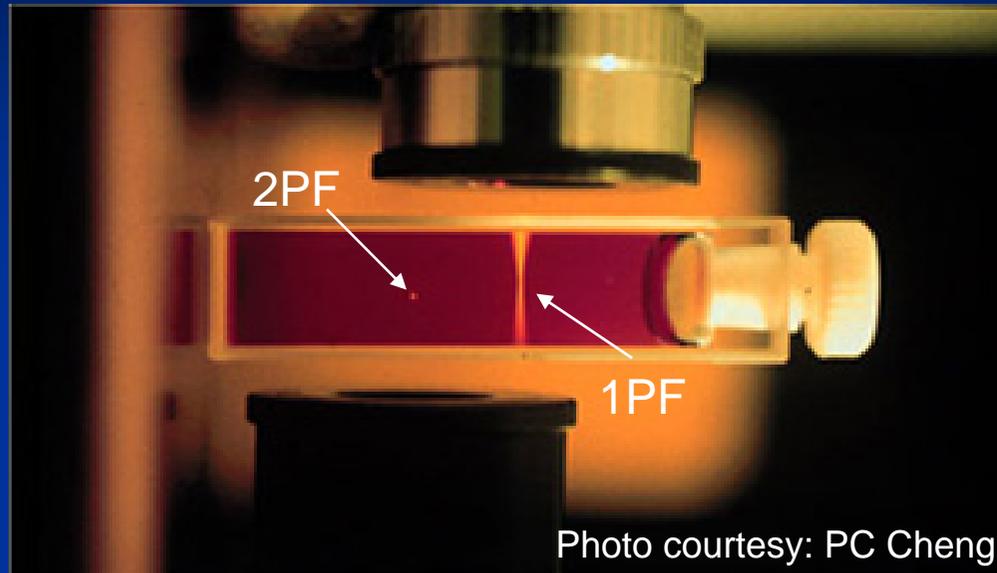

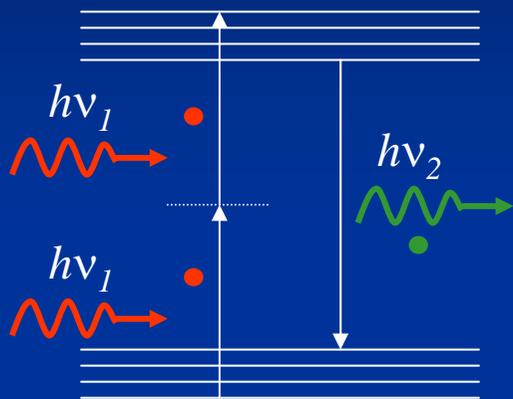

# Single photon confocal microscopy

- Inefficient collection
- Out of focus fluorescence
  - Out of focus photobleach
  - Out of focus photodamage
- Low penetration depth

# Two photon fluorescence (2PF) imaging

- Optical sectioning (automatically confocal)
  - High axial resolution
- Minimized out-of-focus absorption
  - Minimized out of focus photobleach/photodamage
- High penetration depth

# Problems of 2PF microscopy

- Limited penetration depth in live tissues  
(~ 150  $\mu\text{m}$  @ 800 nm)
- Require in-focus two-photon absorption in labeling dye or auto-fluorescent pigment<sup>1</sup>
- Photo-bleaching and photodamages
  - Due to single and multi-photon absorption with NIR<sup>2</sup>
  - To fluorescent and non-fluorescent absorbers
- Limited dye penetration and toxicity issue
- Limited dye availability for structure labeling

⇒ Explore alternative spectral range and intrinsic imaging modality

→ **Harmonics optical microscopy (HOM)**

# Outline

- Introduction
- Principles of optical harmonics
- Experimental setup
- Applications of harmonics imaging
  - Material science
    - GaN material properties mapping
    - 3D Electric field visualization
  - Biological science
    - Bio-photonic crystal probing
    - Tissue imaging
- Summary

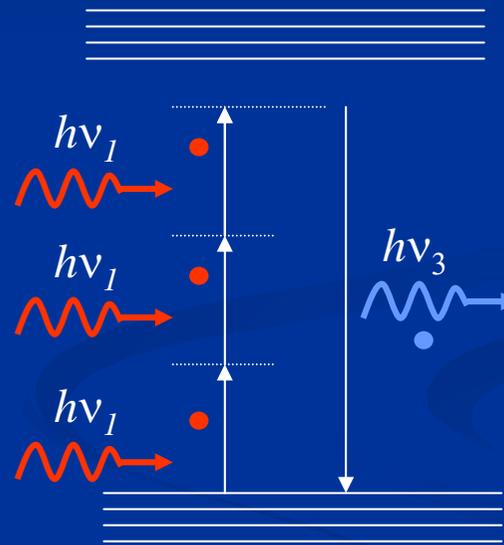

# Optical harmonic generations

- Virtual transition → Energy conservation
- Resonant enhancement

Second Harmonic Generation

$$2h\nu_1 = h\nu_2$$

Third Harmonic Generation

$$3h\nu_1 = h\nu_2$$

# Second harmonic generation

- $P^{NL}(2\omega) = \frac{1}{2} \epsilon_0 \chi^{(2)}(2\omega:\omega, \omega) E(\omega)E(\omega)$ 
  - $I(2\omega) = I(\omega)^2$ 
    - Auto-sectioning capability
  - Allowed only in non-centrosymmetric media<sup>1</sup>
    - Imaging selectivity
    - Surfaces and interface<sup>2</sup>
    - Membrane potentials<sup>3,4</sup>
    - Uniform polarity tissue<sup>5,6</sup>
    - Bio-photonic crystal effect<sup>7,8</sup> (structural proteins<sup>9</sup>)

# Third harmonic generation

- $P^{NL}(3\omega) = \frac{1}{4} \varepsilon_0 \chi^{(3)}(3\omega:\omega, \omega, \omega) E(\omega) E(\omega) E(\omega)$ 
  - $I(3\omega) = I(\omega)^3$ 
    - Better sectioning capability
  - Interfaces with optical inhomogeneity
    - Contour imaging

D. Yelin and Y. Silberberg, *Opt. Express* 5, 169 (1999)

M. Muller *et al.*, *J. Microscopy* 191, 266 (1998).

# Why harmonics?

## Multi-photon Fluorescence

- ✓ Optical Sectioning
- ✓ Deeper penetration due to IR wavelength
- ✗ In-focus absorption/photo-bleaching
- ✗ In-focus photo-damage
- ✗ Staining or auto-fluorescence
- ✗ Strong  $\lambda$  dependency

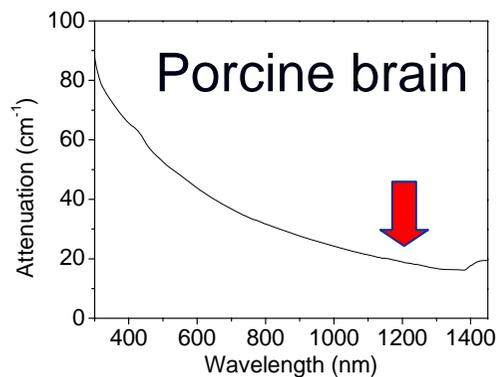

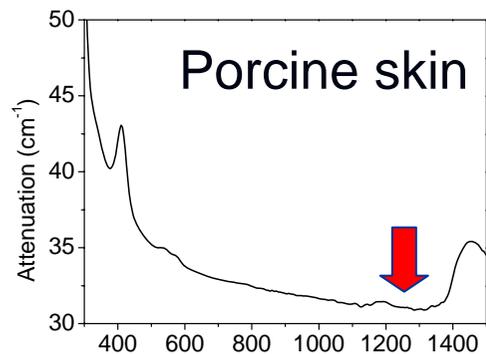

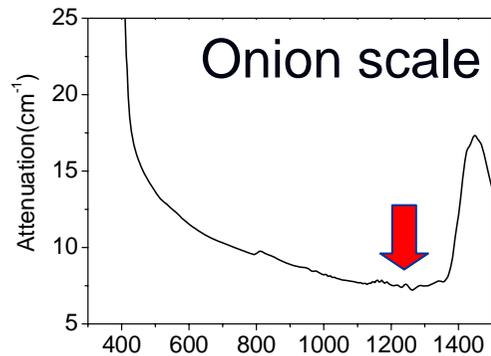

## Harmonics Generation

- ✓ No energy deposition/No absorption/photo-bleaching
- ✓ No photo-damage
- ✓ Endogenous (No staining required)
- ✓ Weak  $\lambda$  selectivity

# Outline

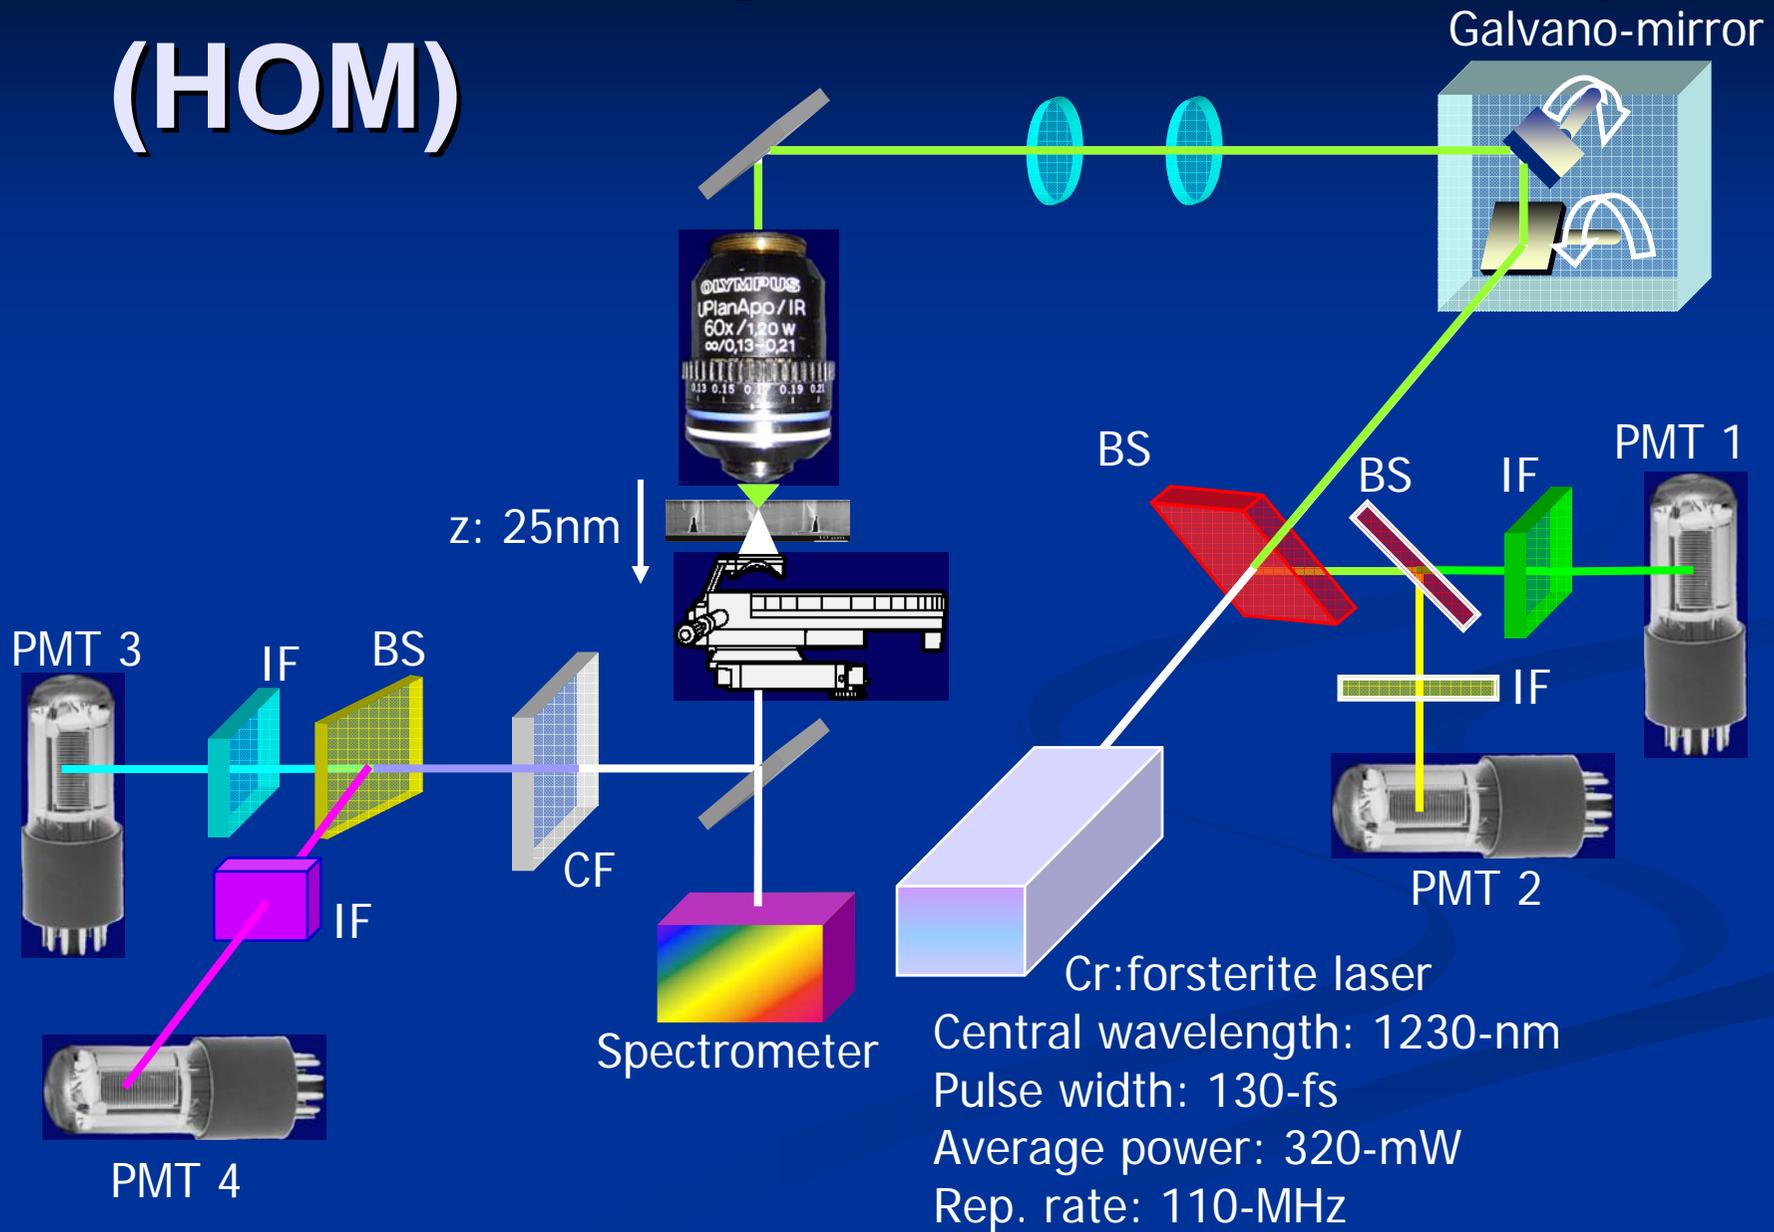

- Introduction
- Principles of optical harmonics
- **Experimental setup**
- Applications of harmonics imaging
  - Material science
    - GaN material properties mapping
    - 3D Electric field visualization
  - Biological science
    - Bio-photonic crystal probing
    - Tissue imaging
- Summary

# Excitation wavelength selection

- Lowest attenuation around 1200 ~ 1300-nm
  - Deepest penetration in biological specimens
  - Both SHG and THG fall in visible regime
  - Reduced multiphoton fluorescence (v.s. 800-nm)
    - Reduced photodamage
  - Fiber compatible
  - Insensitive to silicon detectors

# Harmonics optical microscope (HOM)

# Outline

- Introduction
- Principles of optical harmonics
- Experimental setup
- Applications of harmonics imaging
  - Material science
    - GaN material properties mapping
    - 3D Electric field visualization
  - Biological science
    - Bio-photonic crystal probing
    - Tissue imaging
- Summary

# GaN introduction

- GaN
  - Green-UV optoelectronic devices (LD, LED).
  - High-power/high-speed electronic devices.
- Physical properties are strongly affected by
  - Defect states
  - Large residue piezoelectric field due to unrelaxed strain
  - Both create spectral red-shift and is hard to distinguish in a single-point spectral measurement

GaN LED at 395 nm  
(LEDTronics # L200)

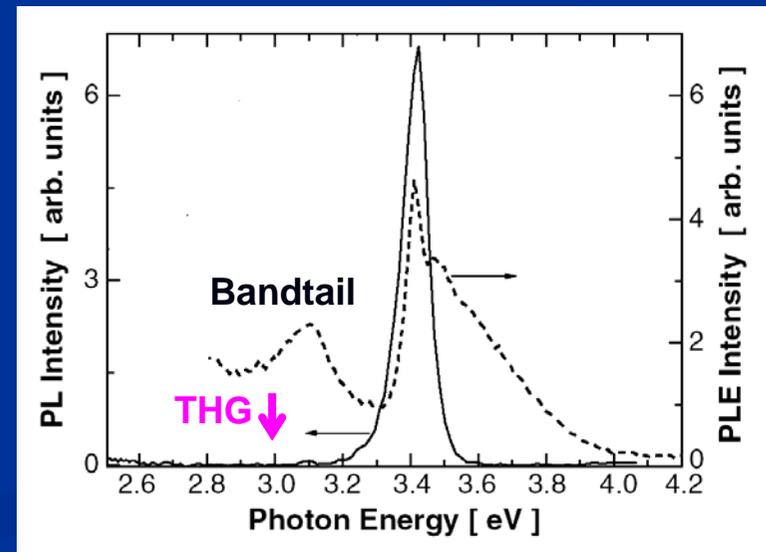

# Motivation

- Observation of electric-field enhanced SHG in GaN<sup>1</sup>

$$P(2\omega) = \varepsilon_0 \chi^2 (2\omega:\omega,\omega) E_{laser} E_{laser} + \varepsilon_0 \chi^3 (2\omega:\omega,\omega,0) E_{laser} E_{laser} E_{residue}$$

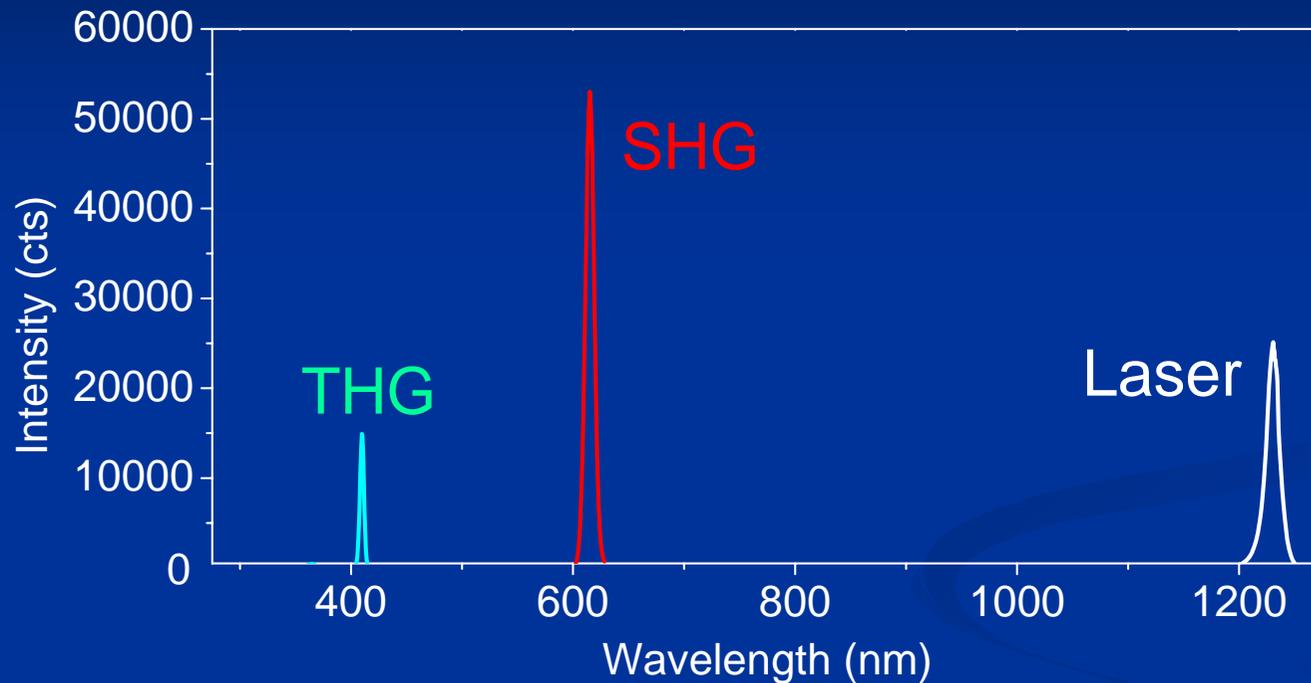

J. Miragliotta & D. K. Wickenden, Phys. Rev. B, v. 53, 1388 (1997).

- With a 1230-nm Cr:forsterite fs laser
  - SHG at 615-nm
    - Piezoelectric-field enhanced
    - Off-resonance
  - THG at 410-nm
    - Bandtail state resonant
    - Defect related

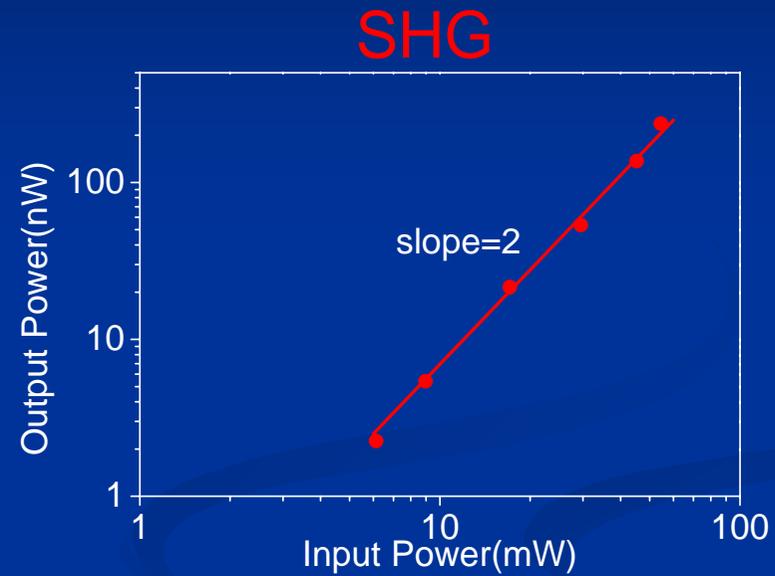

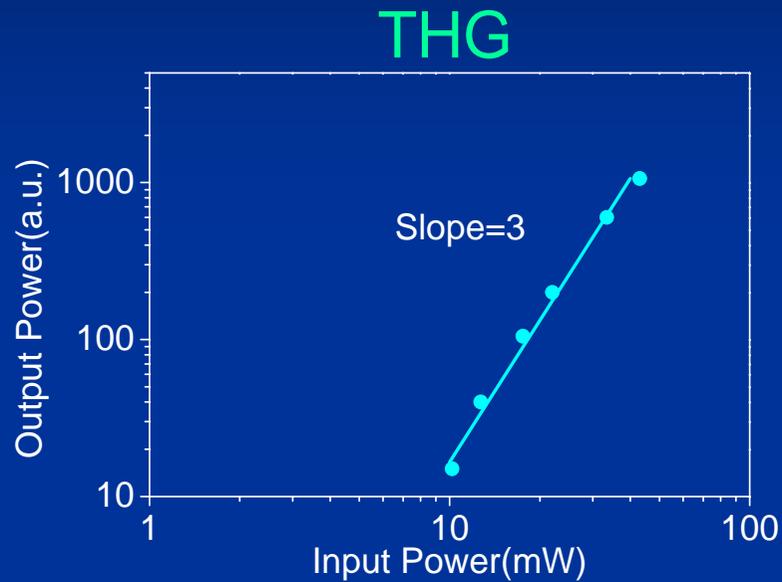

B. Guo et al., Appl. Phys. B 80, 521 (2005).

# Nonlinear emission from a bulk GaN

- SHG at 615-nm
  - Far from GaN resonance
- THG at 410-nm
  - Resonant with the bandtail state

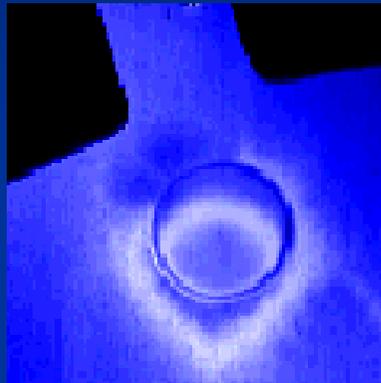

# Power dependency

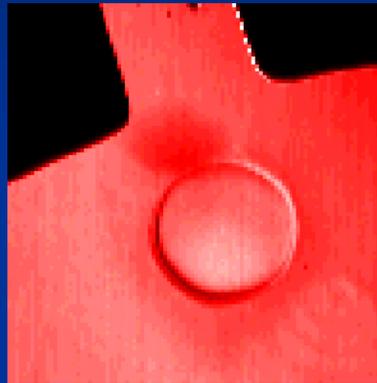

- Confirming 2<sup>nd</sup> and 3<sup>rd</sup> order nonlinearity

# HOM imaging

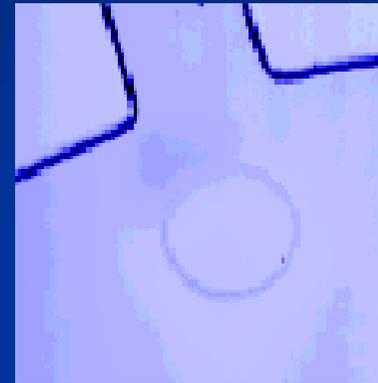

THG

SHG

IR Transmission

- THG  $\rightarrow$  bandtail state distribution
- SHG  $\rightarrow$  piezoelectric field distribution
- Bandtail state density  $\uparrow \rightarrow$  piezoelectric field intensity  $\downarrow$

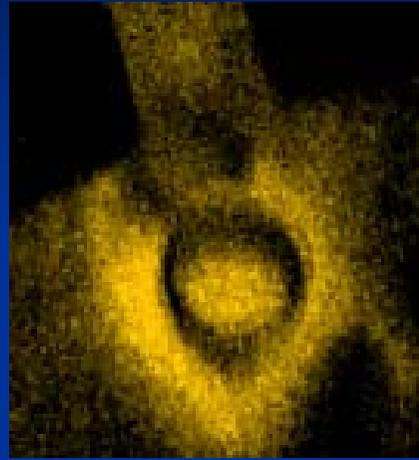

C.-K. Sun & S.-W. Chu et al., *APL* 77, 2331-2333 (2000)

C.-K. Sun & S.-W. Chu et al., *Scanning* 23, 182-192, invited paper (2001)

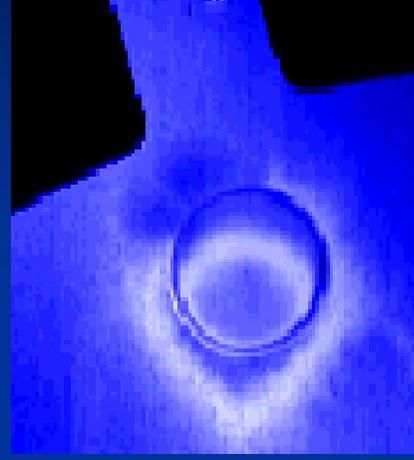

# HOM v.s. PL imaging

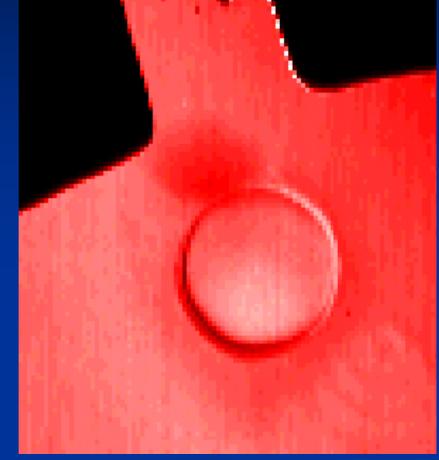

Bandgap  
luminescence  
(365nm)

Defect-state yellow  
luminescence  
(550-600nm)

Bandtail state

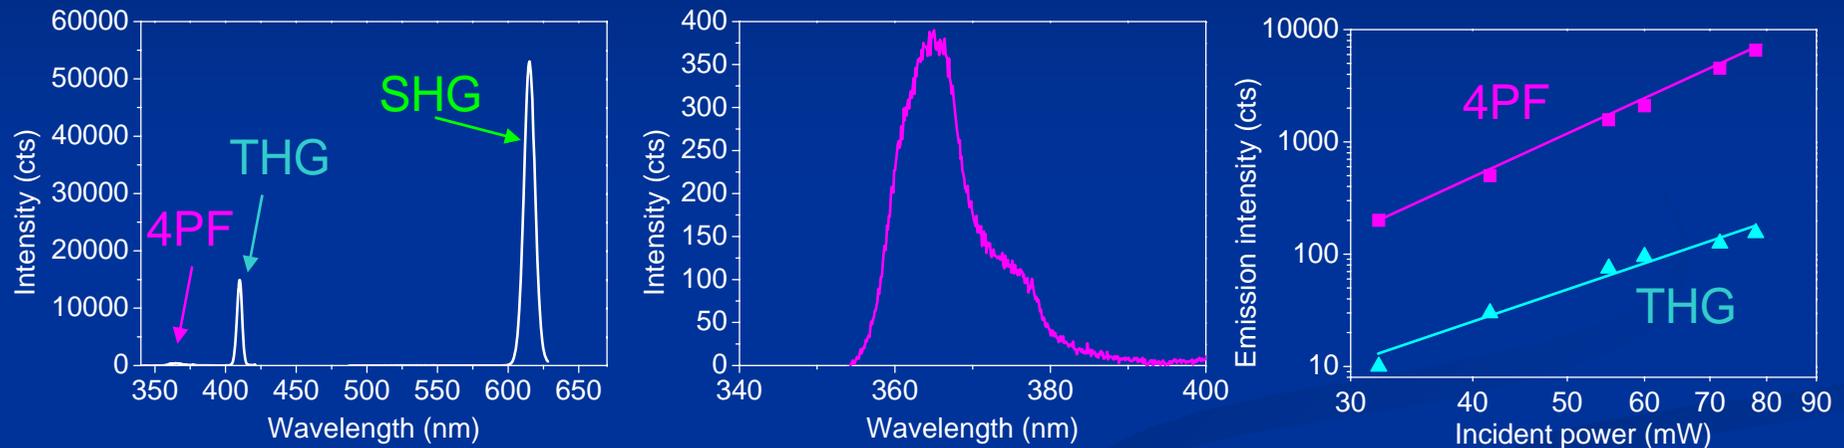

Piezoelectric field

bandgap luminescence ↓ → yellow luminescence ↑  
→ defect-related bandtail state density ↑  
→ piezoelectric field ↓ → strain relaxation

✘ But requires two lasers for imaging

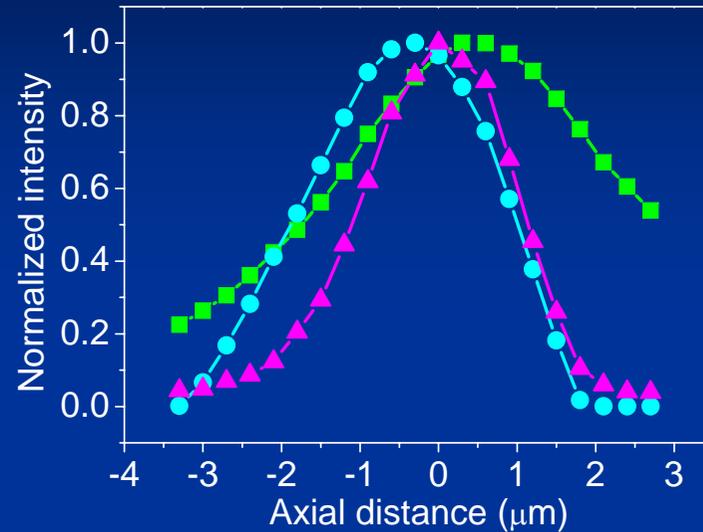

# Multiphoton excitation

5- $\mu\text{m}$  bulk GaN grown on sapphire

- 4-photon fluorescence observed!
  - With a single 1230 nm source
  - 4PF in semiconductor for the first time

# Resolution comparison

- The better axial resolution of 4PF over THG and SHG is demonstrated
- Peak position
  - THG: air/GaN interface
  - SHG: GaN/sapphire interface
  - 4PF: bulk contribution

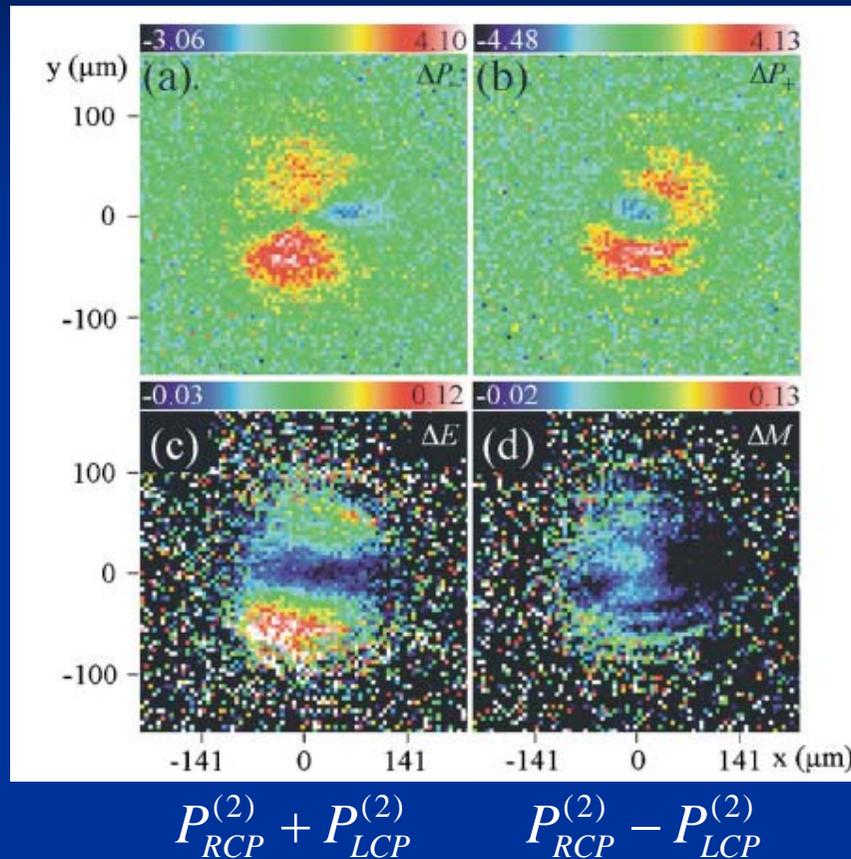

# Potential for spin imaging

Right circularly polarized

Left circularly polarized

$\Delta E$  from gradient of electron density

$\Delta M$  (spin polarization) is opposite in +x and -x directions

- In GaAs/AlGaAs two dimensional electron gas
- Pump-probe SHG measurement

# HOM in semiconductor

- We demonstrated laser scanning SHG, THG microscopy in bulk GaN:
  - SHG to map piezoelectric field
  - THG to map bandtail state
  - bandtail state (defect) density ↑
    - piezoelectric field ↓
    - bandgap PL ↓ → yellow luminescence ↑
- Brand new method to find out the distribution of piezoelectric field and defect state in GaN bulk and MQWs.
- Potential for spin mapping

# Electrical field visualization

- Electric probe
  - Require metal contact
  - Invasive and indirect
- Optical probe
  - E-O sampling<sup>1</sup>
    - Probe head required
    - Low 3D resolution
    - Mapping, not visualization
  - Electrical Field Induced Second Harmonic Generation (EFISHG)

# Characteristics of EFISHG

- Electric Field Induced Second Harmonic Generation

- $P(2\omega) = \varepsilon_0 \chi^3 (2\omega:\omega,\omega,0) E_{laser} E_{laser} E_{applied}$

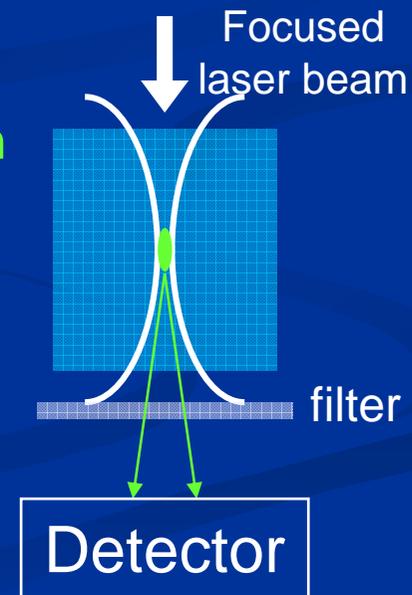

- $I_{EFISHG} \propto (I_{laser})^2$

- $I_{EFISHG} \propto (E_{applied})^2 \propto (V_{applied})^2$

- ◆ Intrinsic sectioning power → 3D visualization

- ◆ Sub- $\mu\text{m}$  resolution

- ◆ Ability of measuring electric field vector  $\vec{E}$

# Visualize E-field by EFISHG

- Surface EFISHG
  - Silicon MMIC<sup>1</sup> & Si/SiO<sub>2</sub> heterojunction<sup>2</sup>
  - Only at interface or surface
  - No 3D imaging capability
- GaN EFISHG<sup>3</sup>
  - 3D E-field imaging
  - Strong residual SHG
- EFISHG in liquid crystal

1. C. Ohlhoff, *APL* **68**, 1699 (1996)

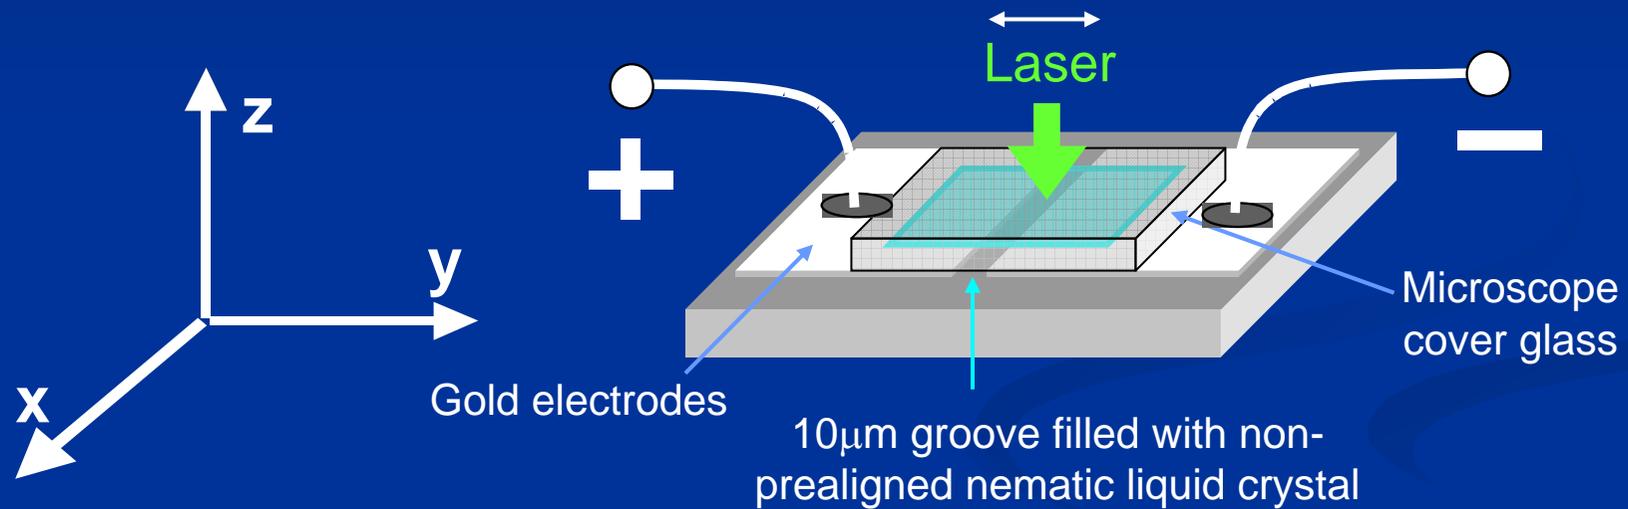

2. J. I. Dadap, *PRB* **53**, R7607 (1996)

3. C. K. Sun, *APL* **77**, 2331 (2000)

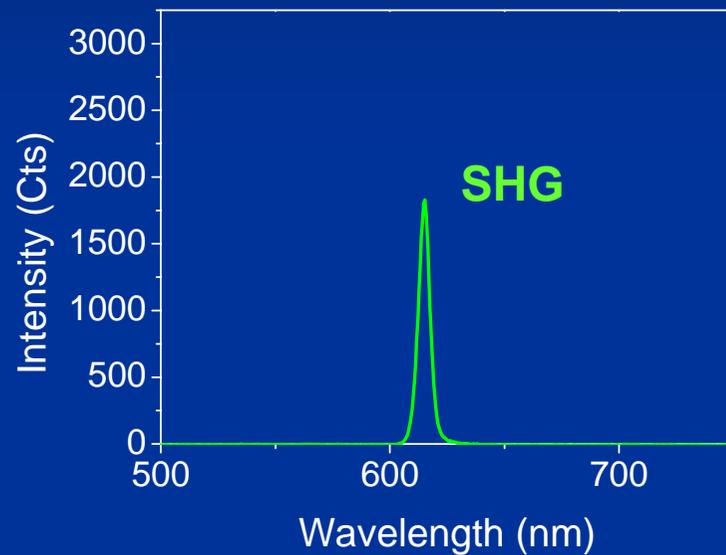

# HOM with EFISHG in liquid crystal crystal

- Advantages:
  - High EFISHG efficiency
  - Background free
  - 3D E-field visualization
  - Measure both amplitude and direction
  - Transparent
  - Non-conducting
  - Easily available

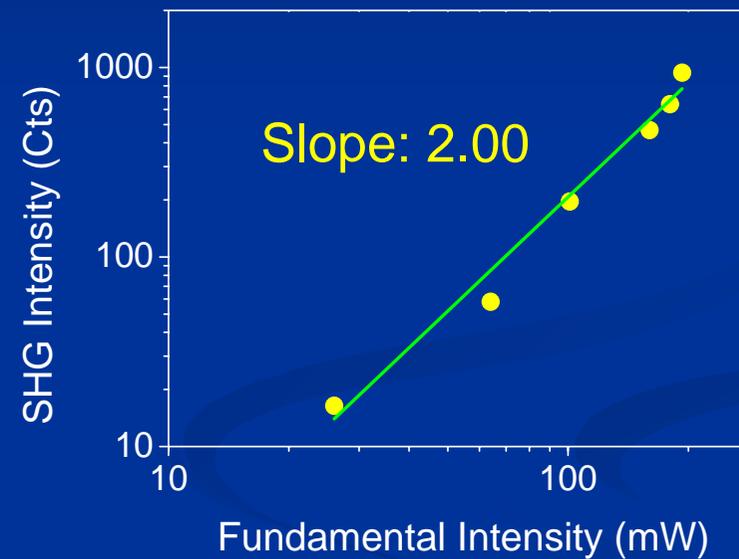

# Integrated-Circuit-Like Sample

# SHG confirmation

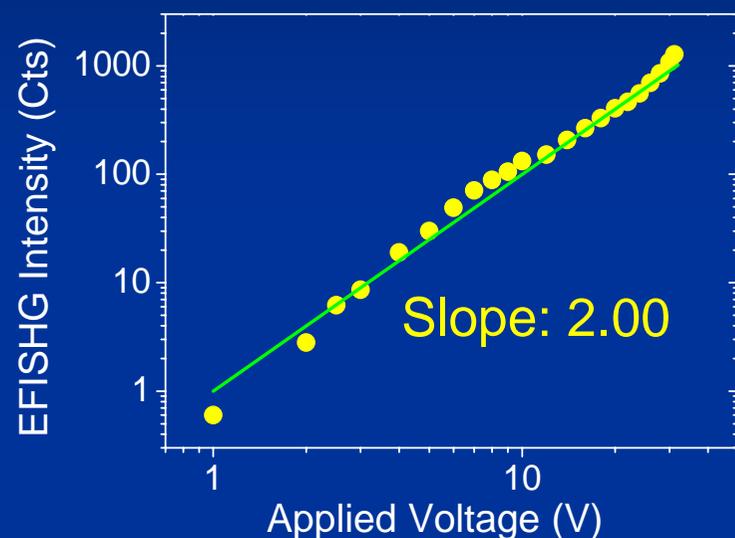

Emission spectrum  
of liquid crystal (30V)

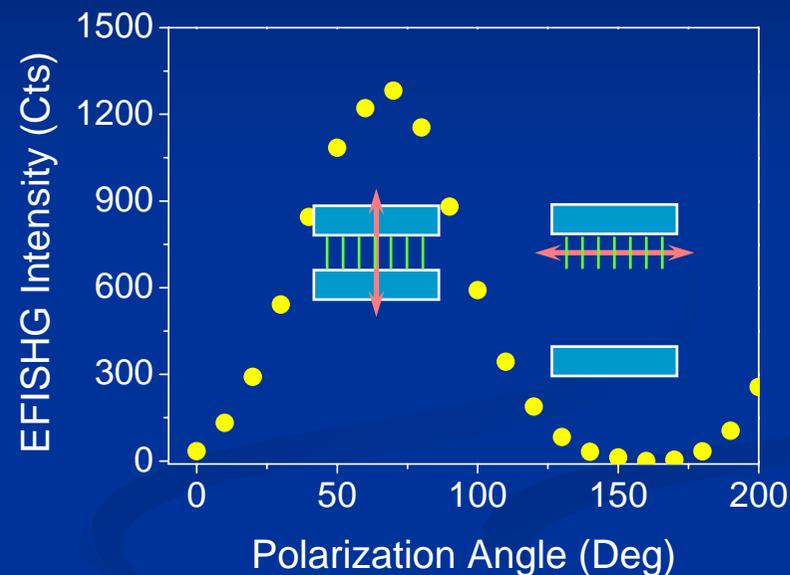

$$I_{\text{EFISHG}} \propto (I_{\text{laser}})^2$$

# EFISHG confirmation

$$I_{\text{EFISHG}} \propto (E_{\text{applied}})^2 \propto (V_{\text{applied}})^2$$

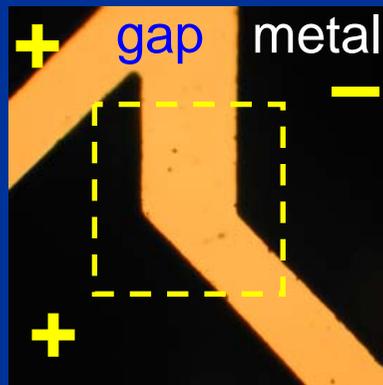

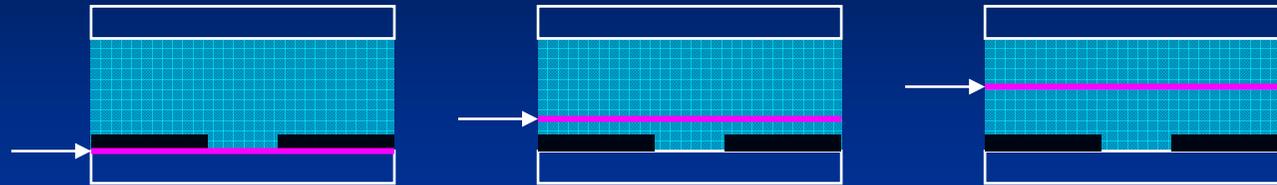

Background free

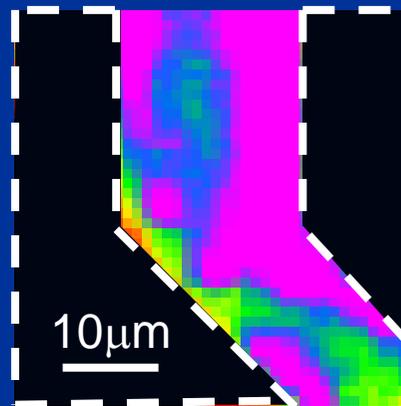

$$\chi^3_{xxxx}(\omega, \omega, 0) \gg \chi^3_{xxxy}(\omega, \omega, 0)$$

Direction sensitive

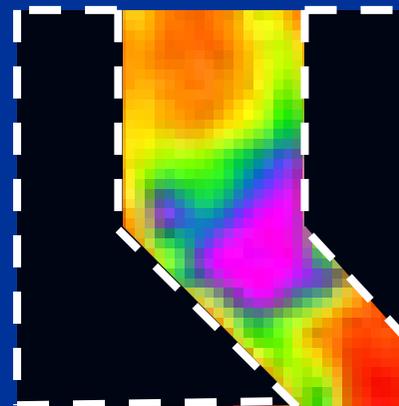

# Depth resolution

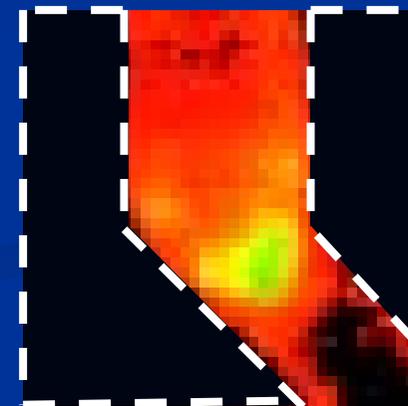

polarization

In the plane of  
the electrode

2.5 $\mu\text{m}$  higher

5 $\mu\text{m}$  higher

strong

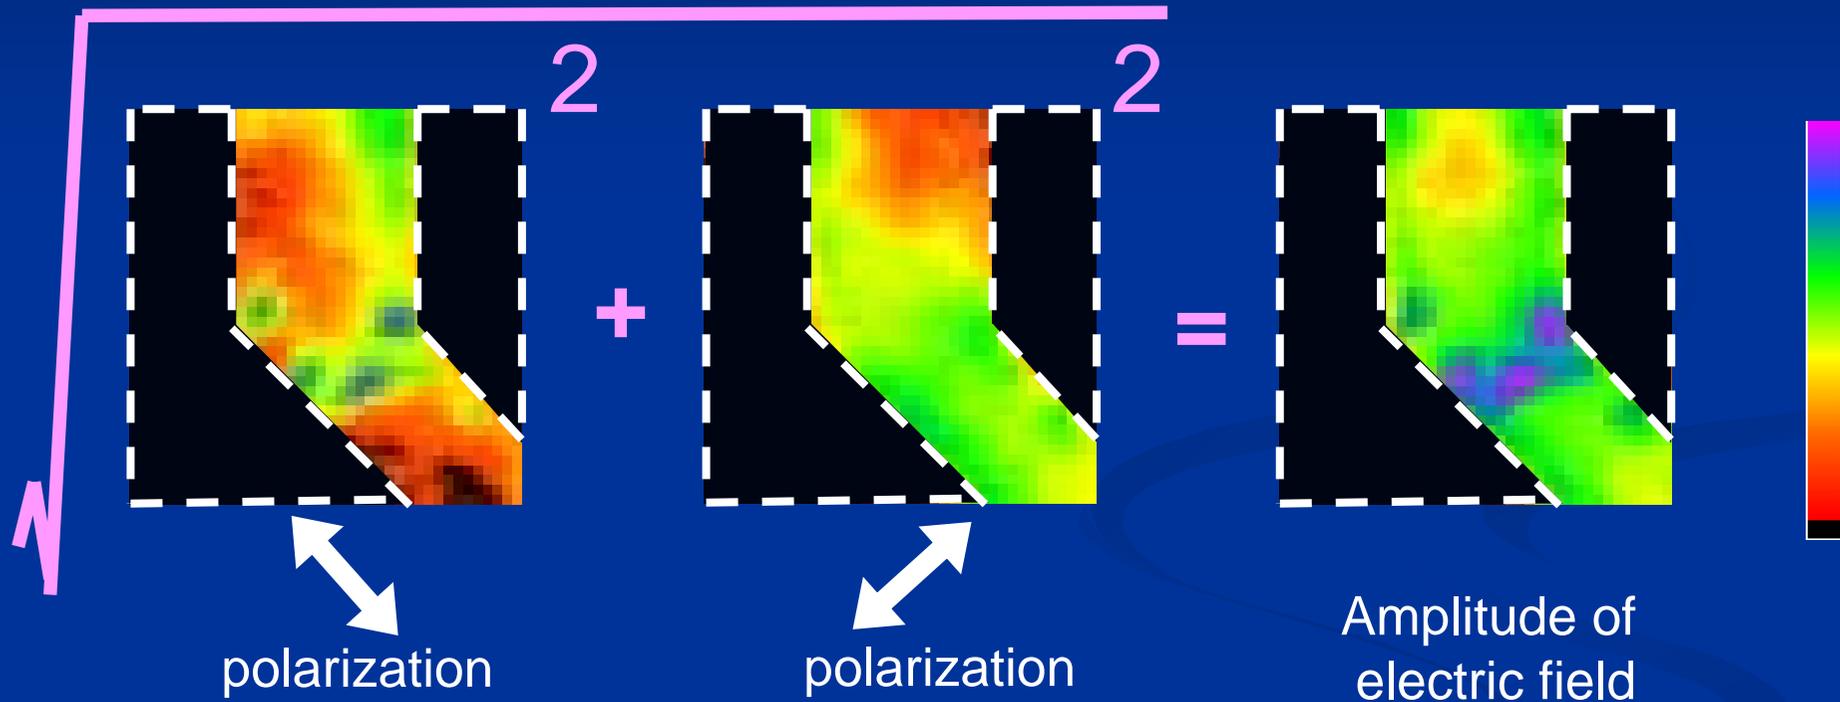

weak

Resolution:  $xy \sim 0.5\mu\text{m}$ ,  $z \sim 1\mu\text{m}$

# E-field visualization

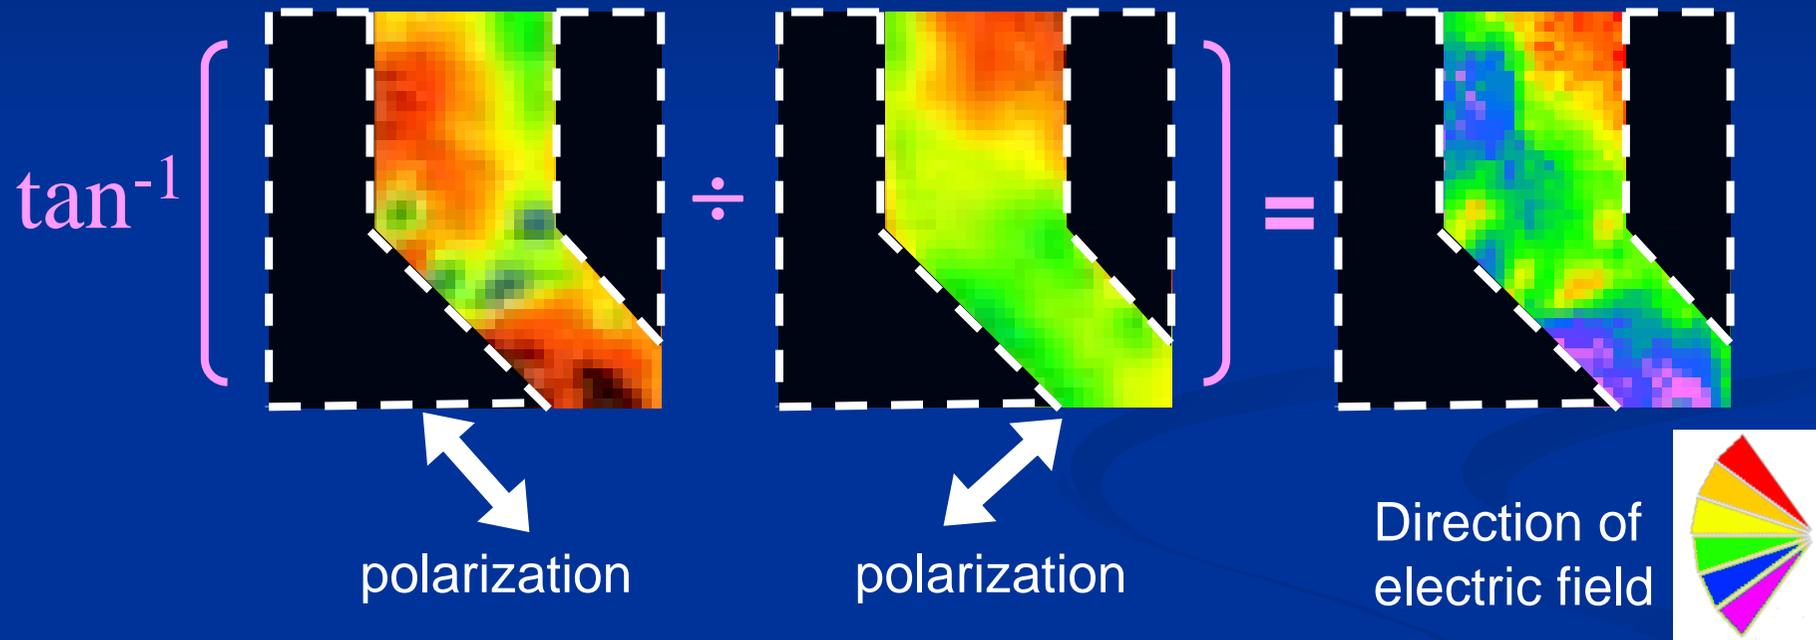

- Amplitude reconstruction

$$\sqrt{E^2 + E^2} = |\vec{E}|$$

# E-field visualization

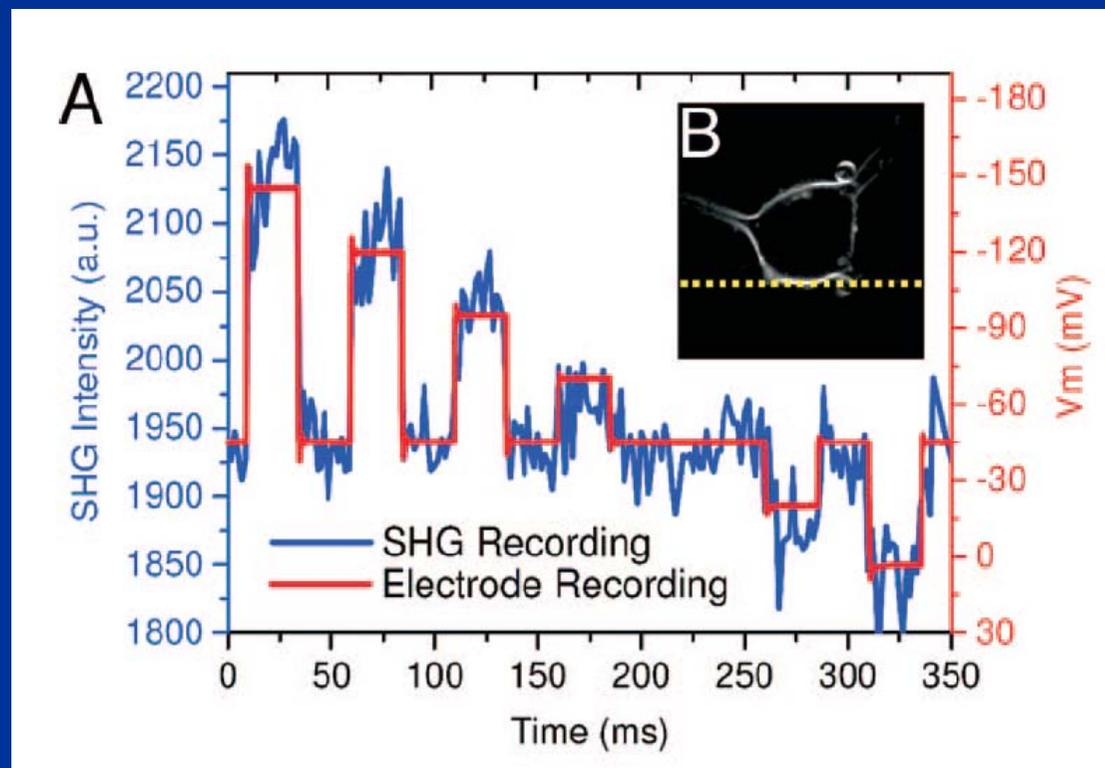

- Direction reconstruction

$$\tan^{-1} \left( \frac{E_{\swarrow}}{E_{\searrow}} \right) = \angle \vec{E}$$

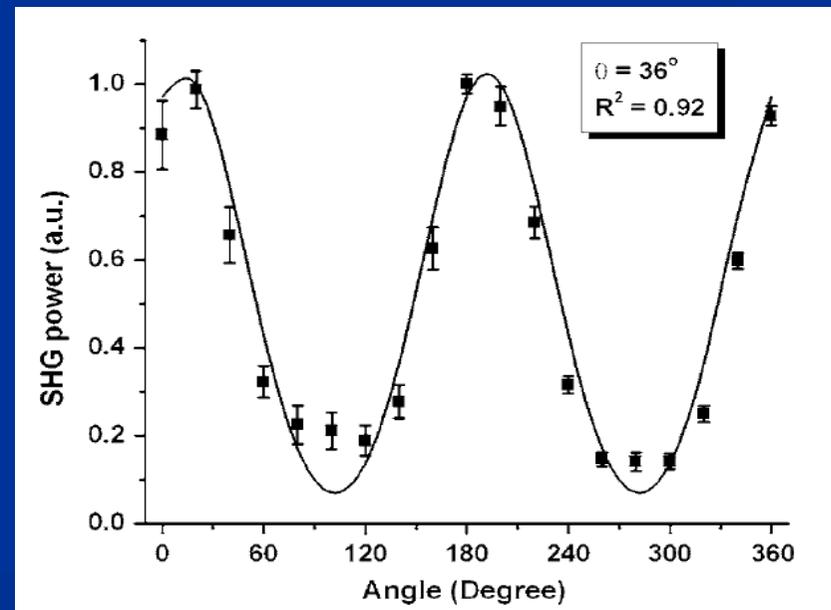

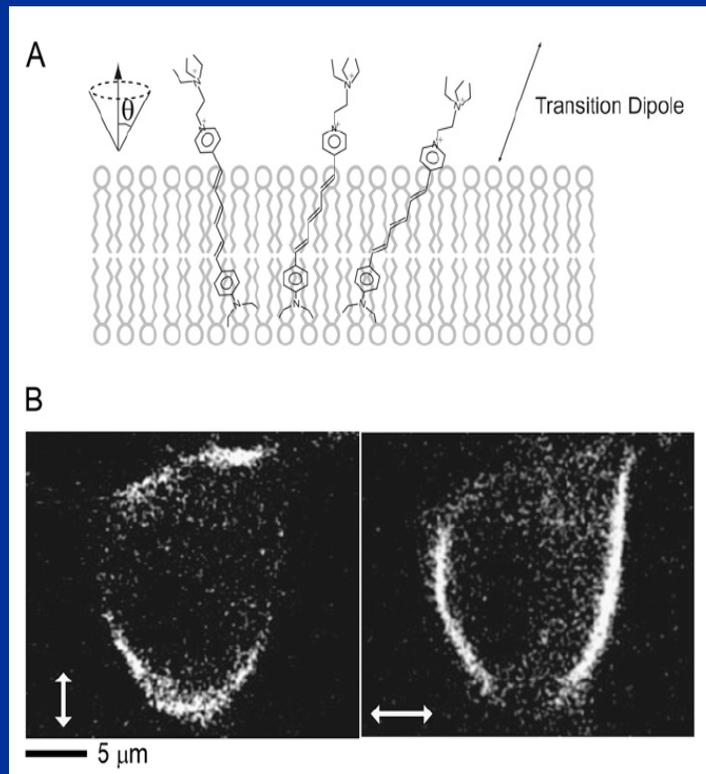

# Electric field in neuron

- SHG imaging for neural action potential visualization

# Electric field in neuron

- Polarization anisotropy of SHG on neurons
  - The molecular orientation is deduced

# HOM for E-field visualization

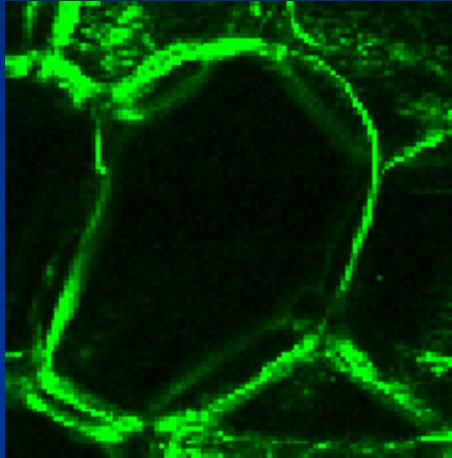

- HOM with EFISHG in LC
  - First 3D E-field visualization
  - Sub- $\mu\text{m}$  spatial resolution
  - Background free
  - Obtain E-field vector
    - Z-component  $\rightarrow$  sample rotation
- Action potential in neuron

# Outline

    - Tissue imaging
- Summary

# SHG imaging in biological tissues

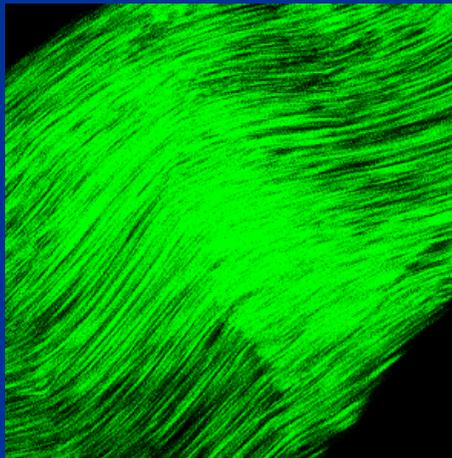

Cellulose in  
cell wall of  
maize stem

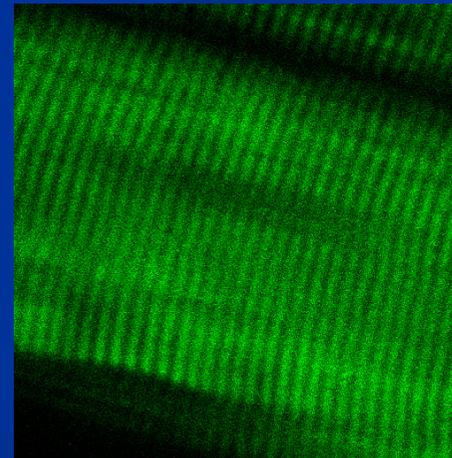

Starch and  
grana in  
mesophyll cells

Collagen of  
tendon fiber

Myosin in  
muscle fiber

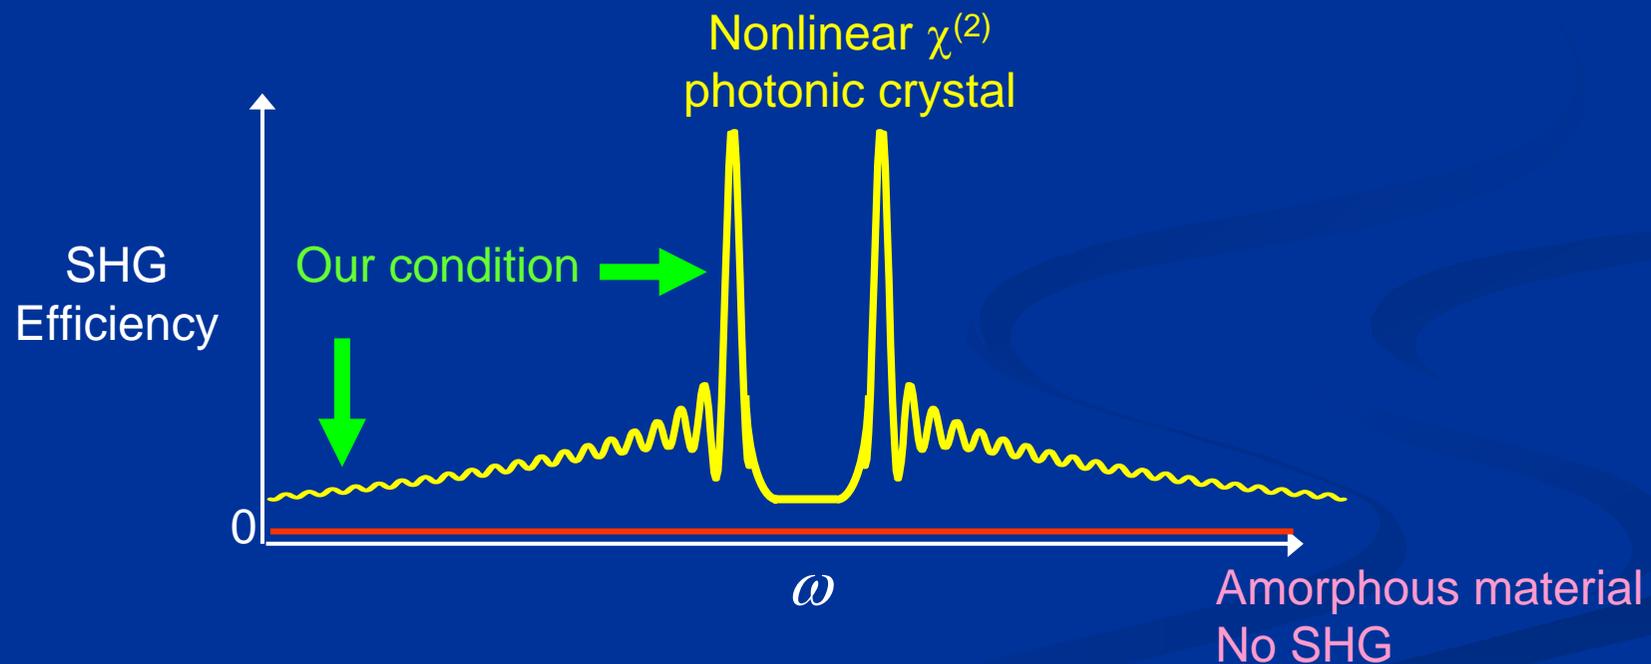

Hint of  
crystallinity

■ No labeling at all!

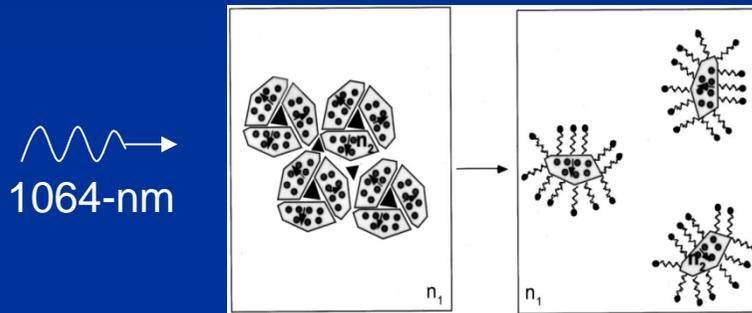

# Nonlinear photonic crystal

- $\chi^{(2)}$  existed even with pump frequency not close to photonic bandgap.

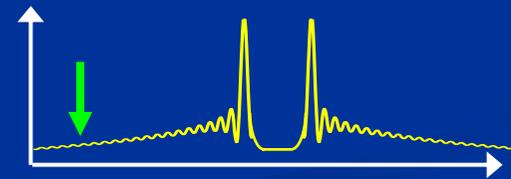

# Nonlinear bio-photonic crystal

- First observed in bR (~ 5-nm period)
- Strong SHG is observed
  - No SHG after bR was hydrolyzed

Bacteriorhodopsin (bR)  
on purple membrane

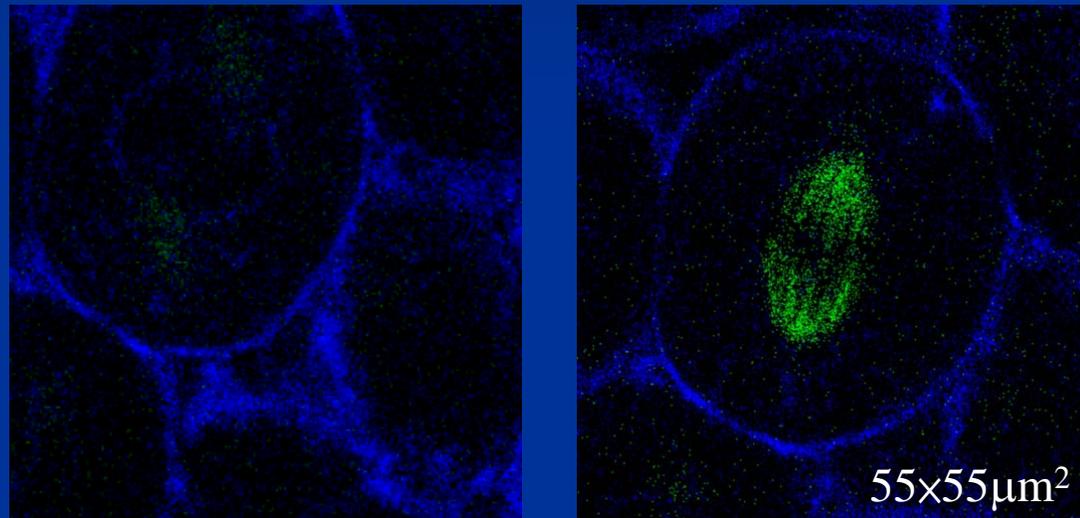

K. Clays, *JOSA B* 18, 1474 (2001).

- Lots of orderly-arranged nano-structure in biology
  - Stacked membranes: starch granule, grana, mineral deposition
  - Arrayed microtubules: cellulose microfibrils, myofibrils in a muscle fiber, and collagen bundles, etc.
- Can be studied by SHG

# Nonlinear biophotonic crystal

Mitosis spindle of a zebrafish blastoderm THG + SHG

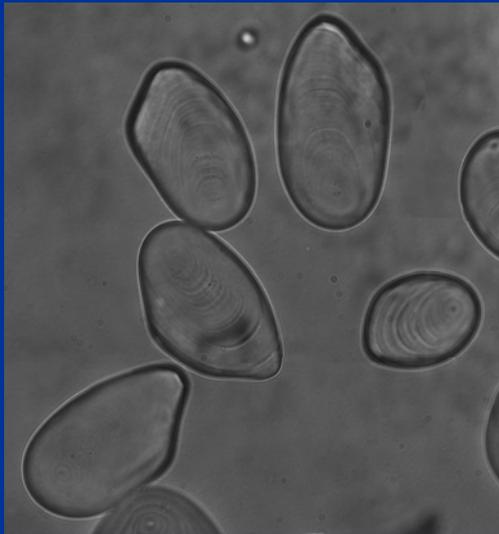

- SHG
  - Crystallized microtubule array
  - Diminished after the microtubules dispersed
- THG
  - Cellular and nuclear plasma membranes

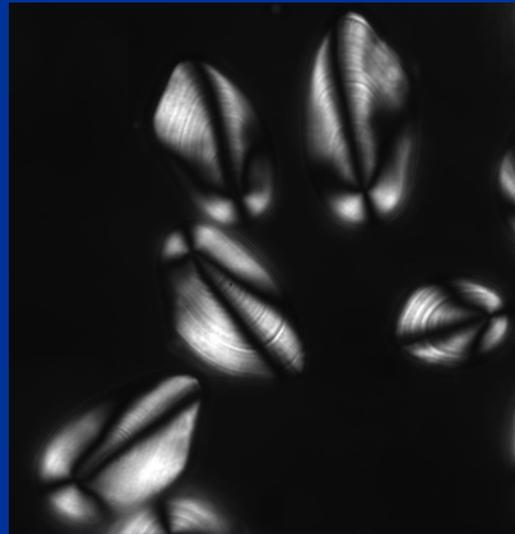

# Biophotonic crystal

- Can we find the arrangement symmetry of underlying molecules by SHG?
  - Active molecule identification
  - Molecular structural/packing information elucidated

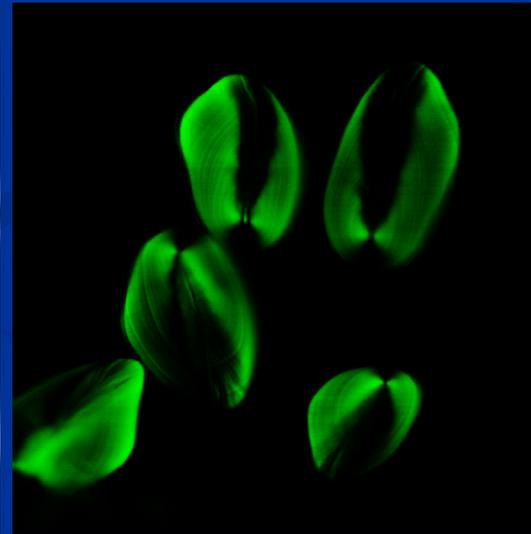

# SHG of starch

Bright field

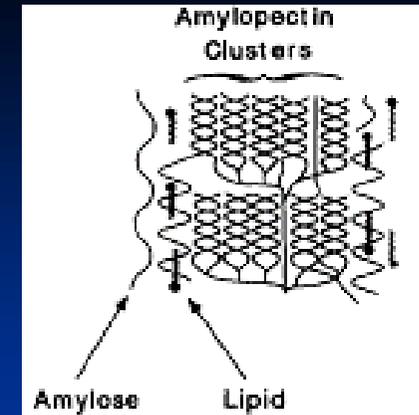

Polarized microscope

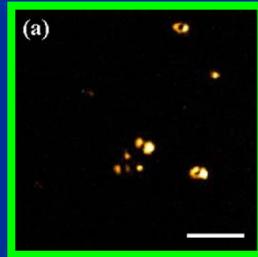

SHG

# Molecular origin of starch SHG

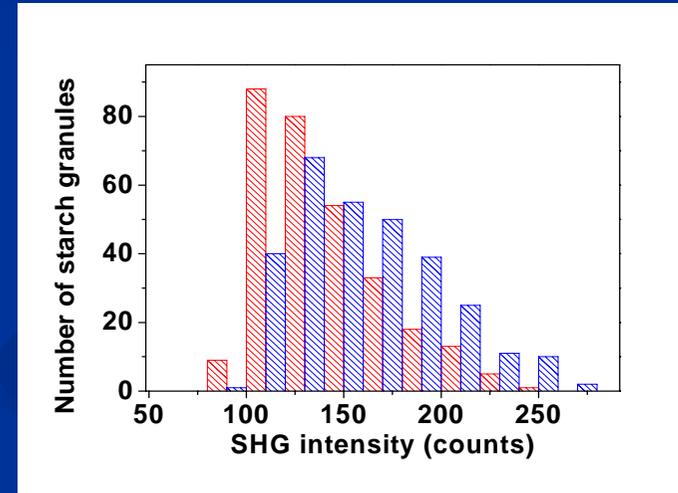

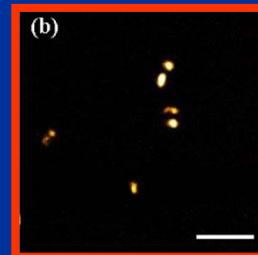

## ■ Amylopectin<sup>1</sup> or amylose<sup>2</sup>?

Japonica rice  
Amylopectin: 86%  
Amylose: 14%

Japonica waxy rice  
Amylopectin: 99%  
Amylose: 1%

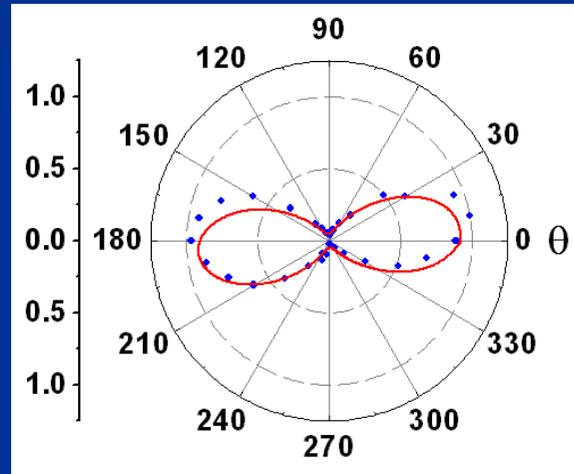

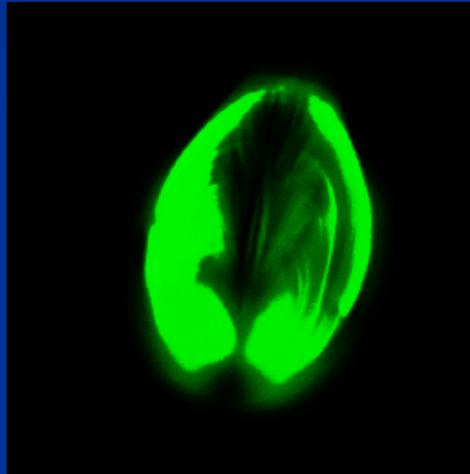

SHG from Japonica waxy rice is 15% stronger

➔ **SHG from amylopectin!!**

1. S.-W. Chu, *J. Microscopy*, **208**, 190 (2002)
2. G. Cox, *J. Biomed. Opt.* **10**, 024013 (2003)
3. In preparation to *Biophys J*

# SHG of starch

- Full  $\chi^{(2)}$  tensor and molecular orientation are deduced

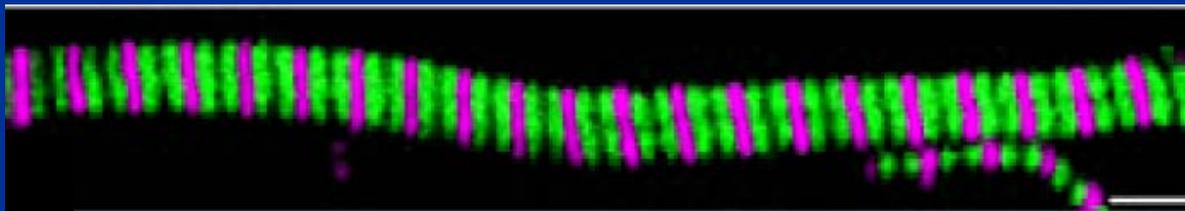

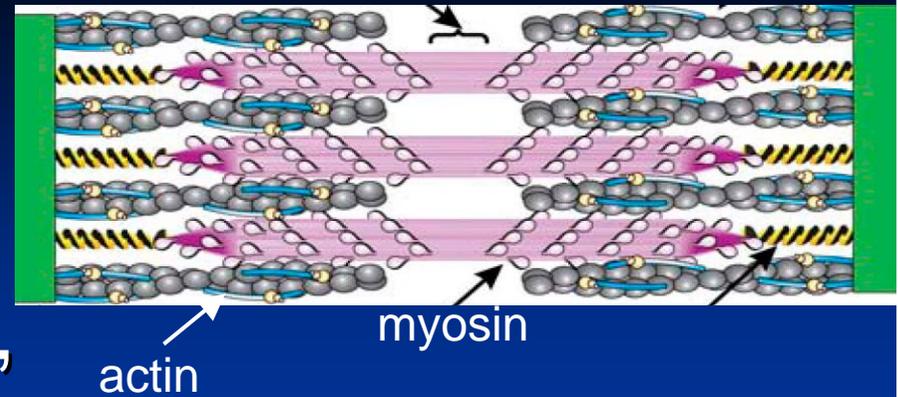

$$SHG \propto \left( \chi_{16}^{(2)} \sin 2\theta \right)^2 + \left( \chi_{21}^{(2)} \sin^2 \theta + \chi_{22}^{(2)} \cos^2 \theta \right)^2$$

$$\chi^{(2)} = \chi_{16}^{(2)} \begin{bmatrix} 0 & 0 & 0 & 0 & 0 & 1 \\ 0.23 \pm 0.09 & 0.95 \pm 0.04 & 0.23 \pm 0.09 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 0 & 0 \end{bmatrix}$$

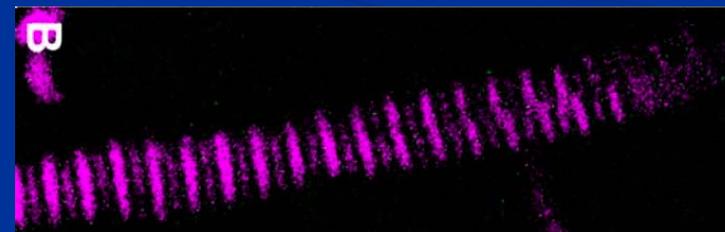

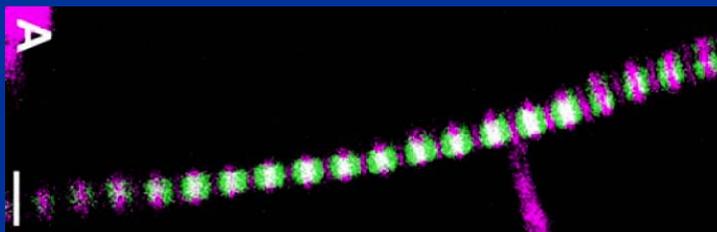

# SHG in muscle

- From myosin filaments, not actin

— SHG  
— Actin

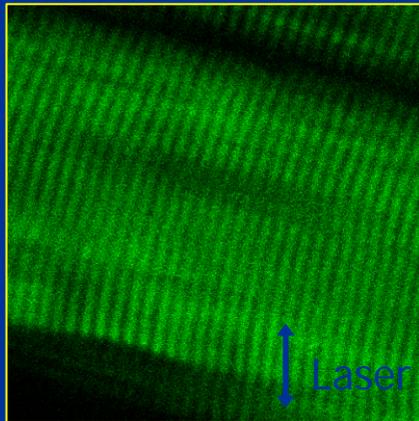

Myosin extracted

# 2D Bio-photonic crystal in animal

Muscle fibers

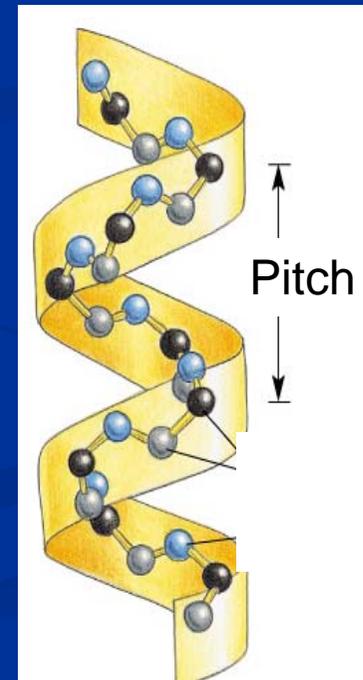

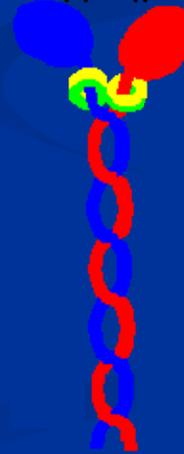

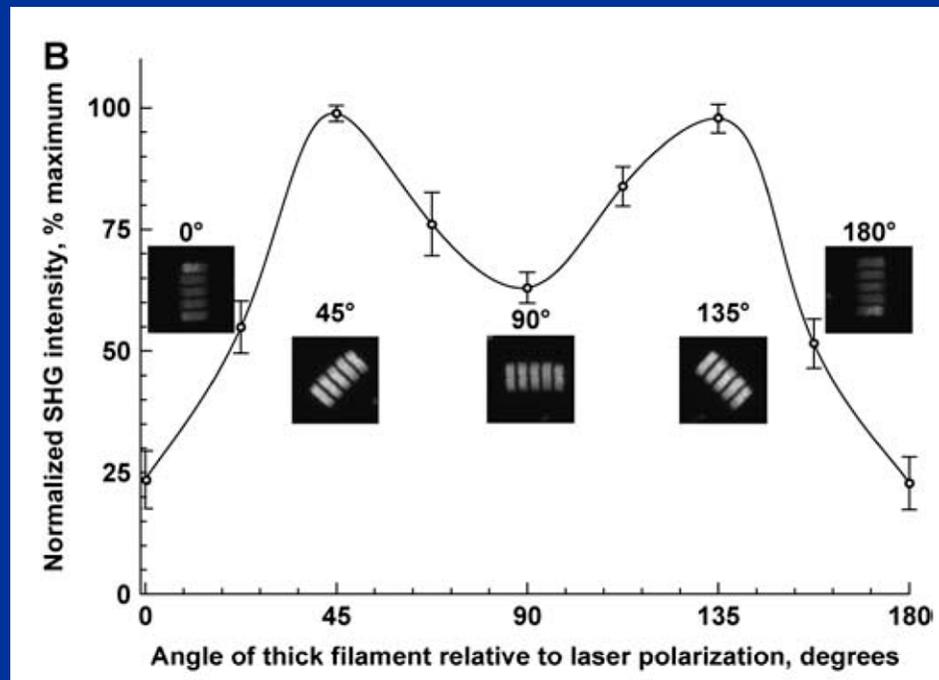

- Full  $\chi^{(2)}$  tensor is resolved
  - Based on cylindrical symmetry assumption

$$\chi^{(2)} = \chi_{31}^{(2)} \begin{bmatrix} 0 & 0 & 0 & 0 & 1.15 & 0 \\ 0 & 0 & 0 & 1.15 & 0 & 0 \\ 1 & 1 & 0.09 & 0 & 0 & 0 \end{bmatrix}$$

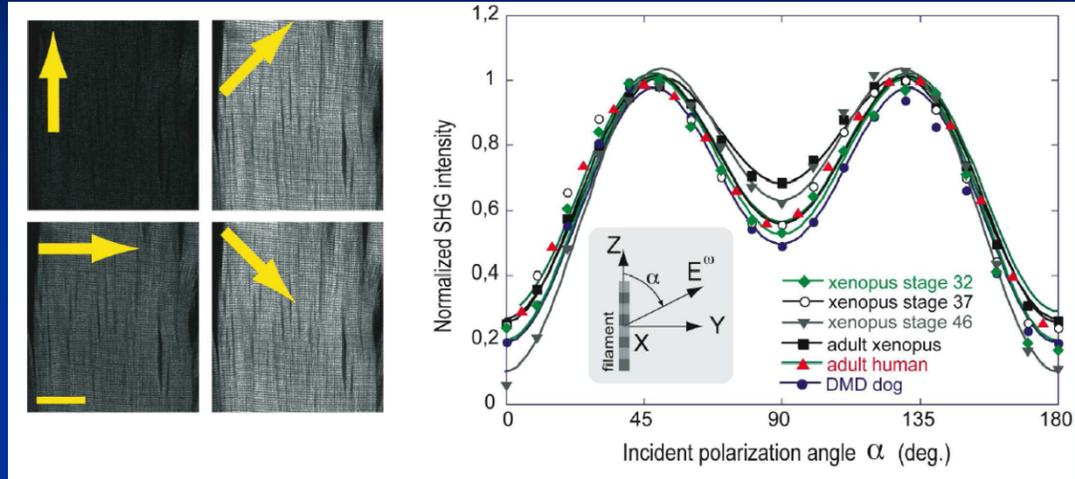

# SHG from myosin

- Polarization anisotropy
  - SHG from coiled-coil filaments of myosin
  - The inclination angle of molecular coil is determined by fitting the anisotropy
    - 61.2 deg, matching X-ray diffraction results

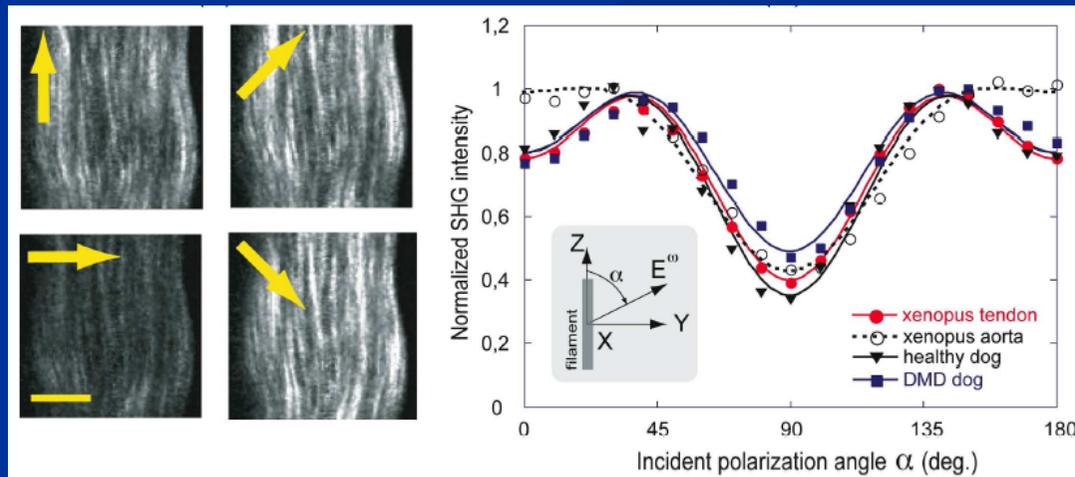

# SHG anisotropy

## ■ Muscle

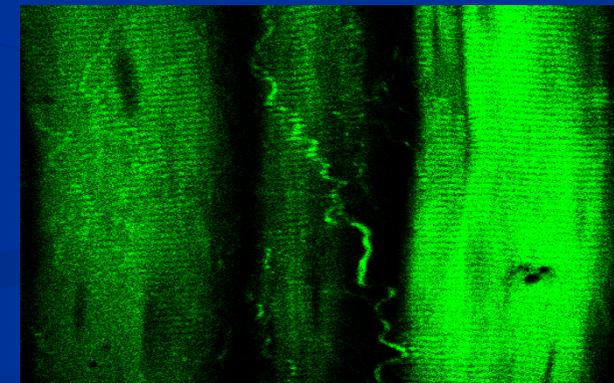

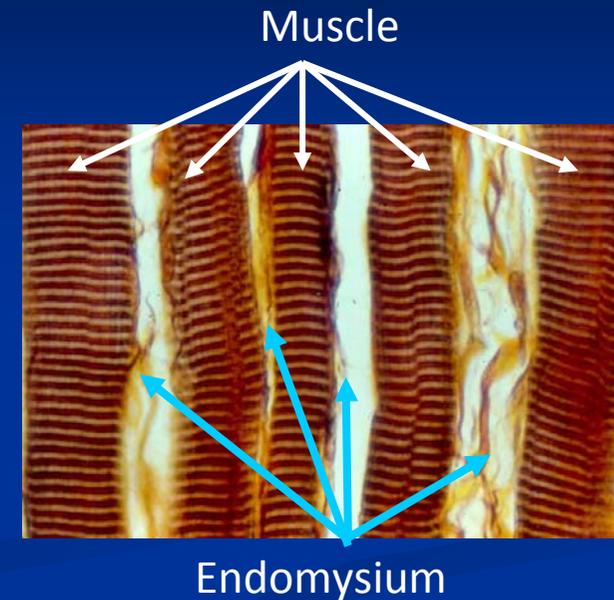

## ■ Collagen

# Selective imaging by SHG

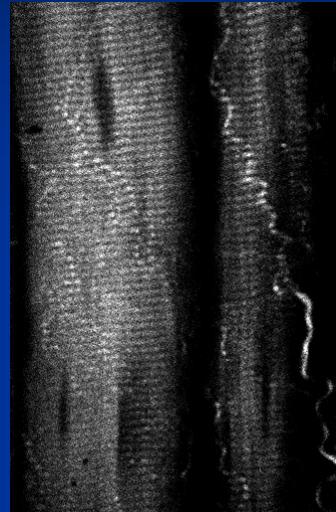

- Biological tissues usually entangle with each other
  - e.g. muscle fiber & collagen-based endomysium
- Both exhibit strong SHG
- How to selectively observe them without staining?

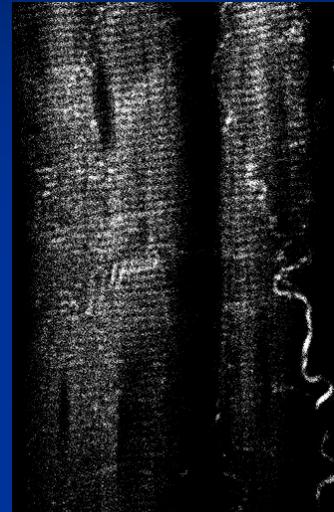

# Polarization based selective imaging

Over 100-fold contrast enhancement

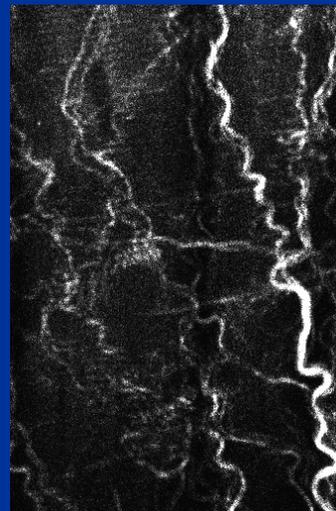

Laser polarization  $\longleftrightarrow$   
Polarizer  $\longleftrightarrow$

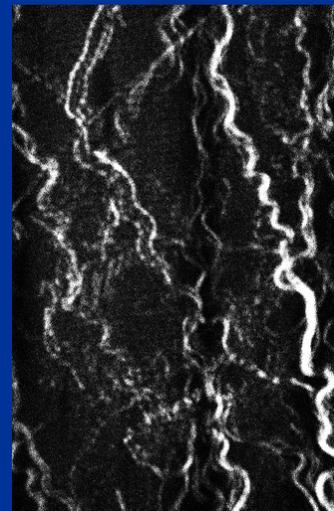

Laser polarization  $\longleftrightarrow$   
Polarizer  $\updownarrow$

Laser polarization  $\updownarrow$   
Polarizer  $\longleftrightarrow$

Laser polarization  $\updownarrow$   
Polarizer  $\updownarrow$

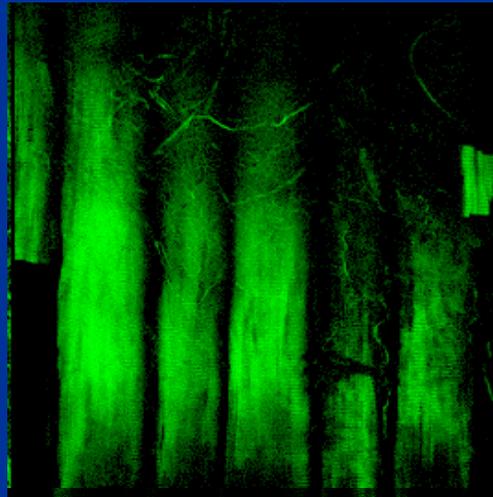

# Emission dipole based selective imaging

- Muscle fibers: FSHG dominated
- Collagen: both FSHG and BSHG

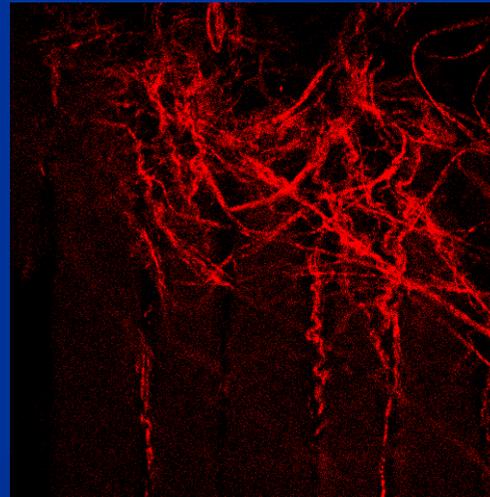

Forward-SHG

Polarizer  $\longleftrightarrow$

Backward-SHG

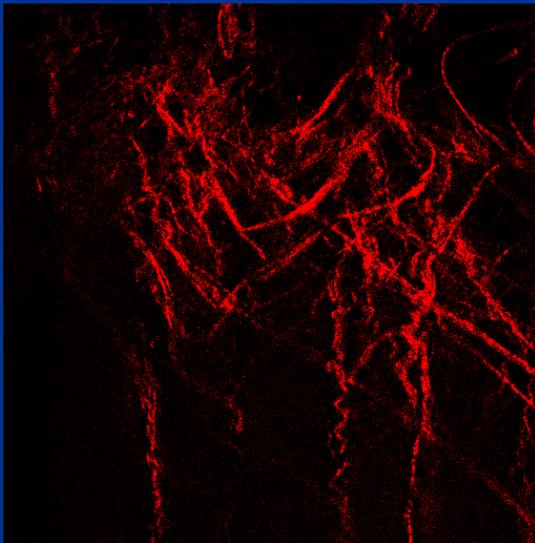

No polarizer

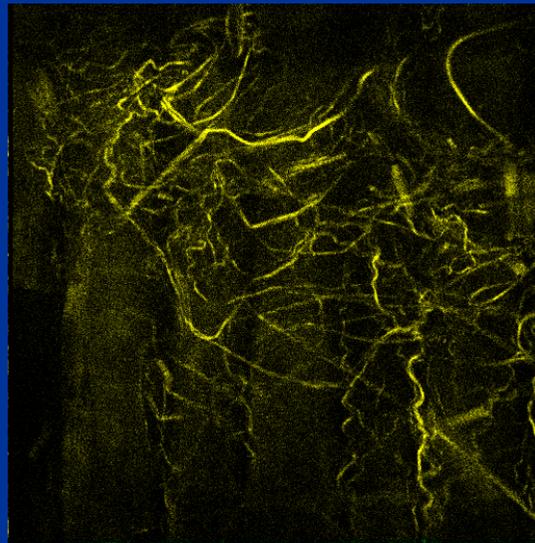

Laser polarization  $\longleftrightarrow$

# BSHG vs. FSHG

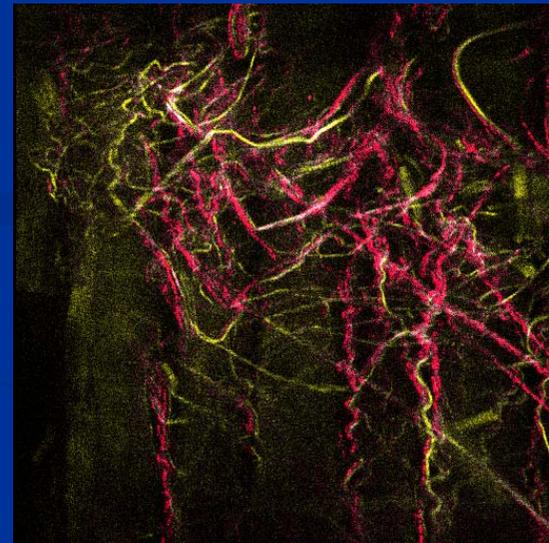

- They do not overlap well
  - BSHG does not come merely from backscattering

BSHG

FSHG

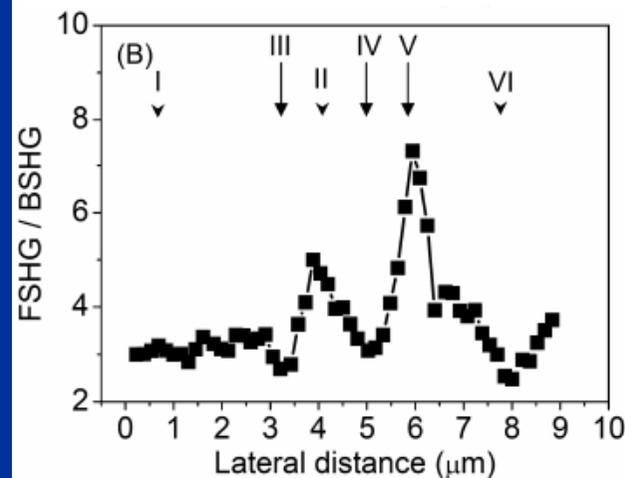

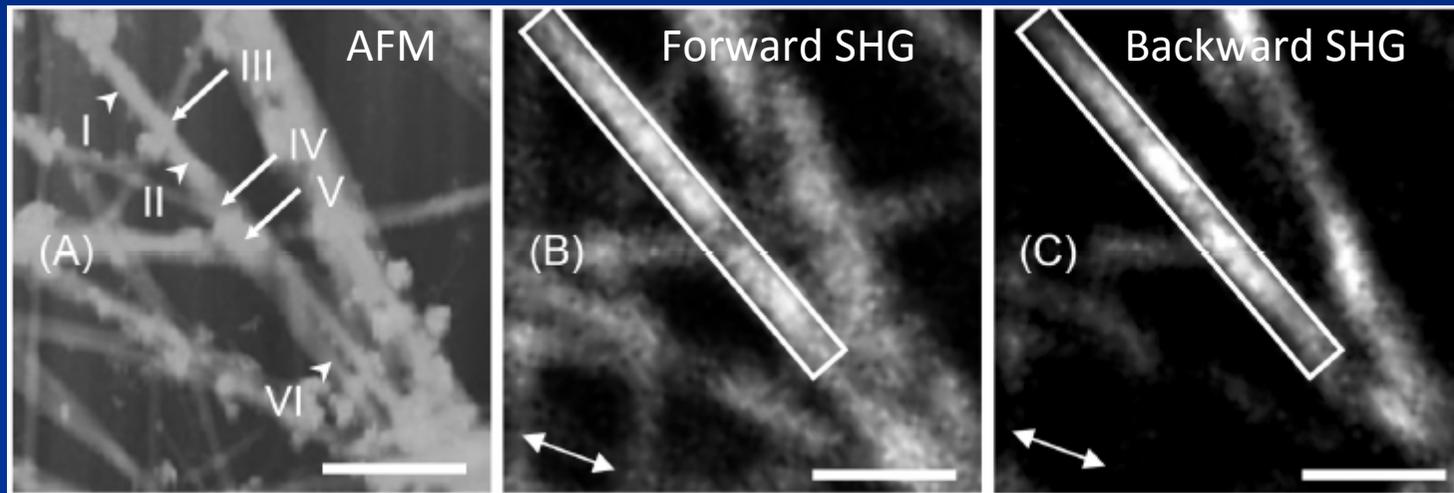

B+FSHG

Laser polarization  $\updownarrow$   
Polarizer  $\updownarrow$

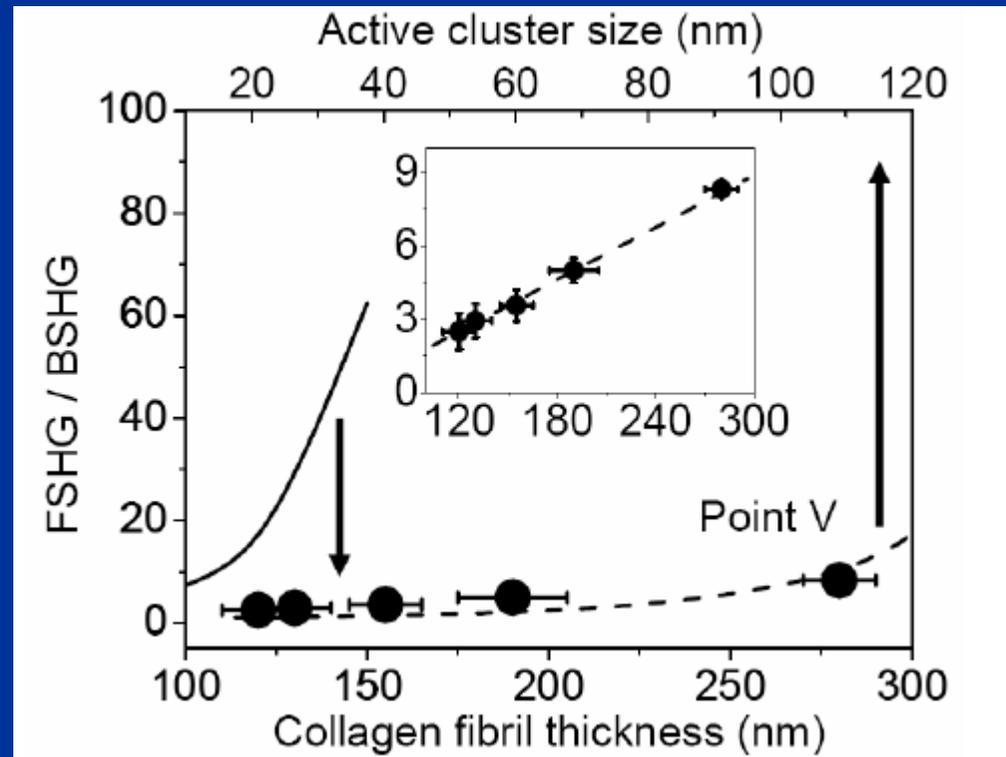

# BSHG vs. FSHG

- Thickness determination in a collagen fibril

# Thickness of a collagen fibril

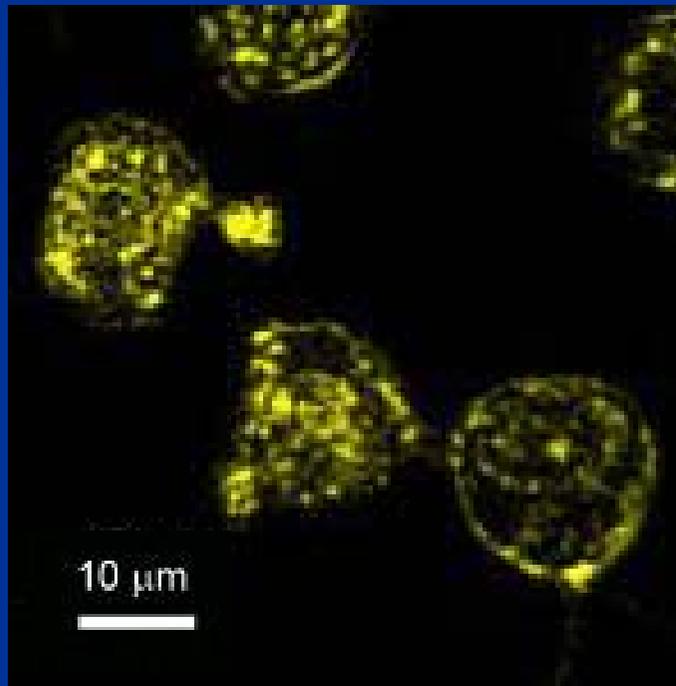

- Determined by FSHG/BSHG ratio
  - Ten nanometer precision

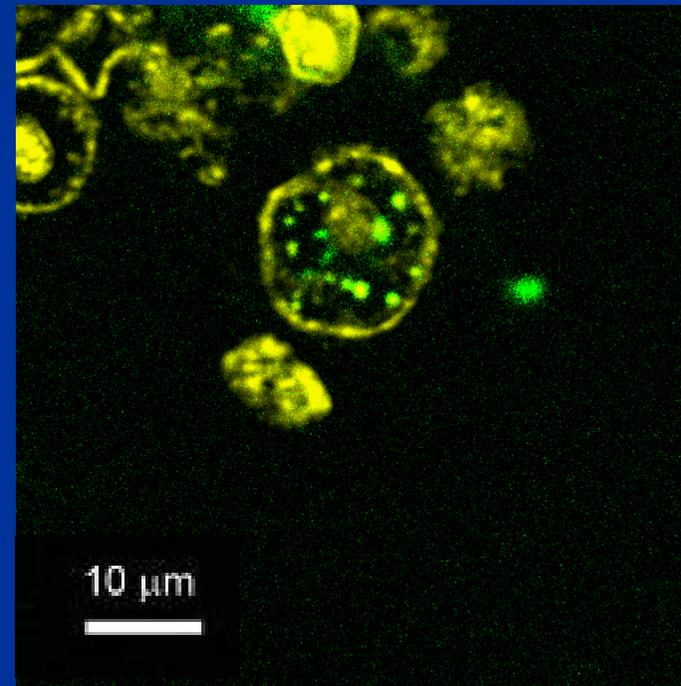

# Virus imaging

- No labeling is required

Normal cells

Infected cells

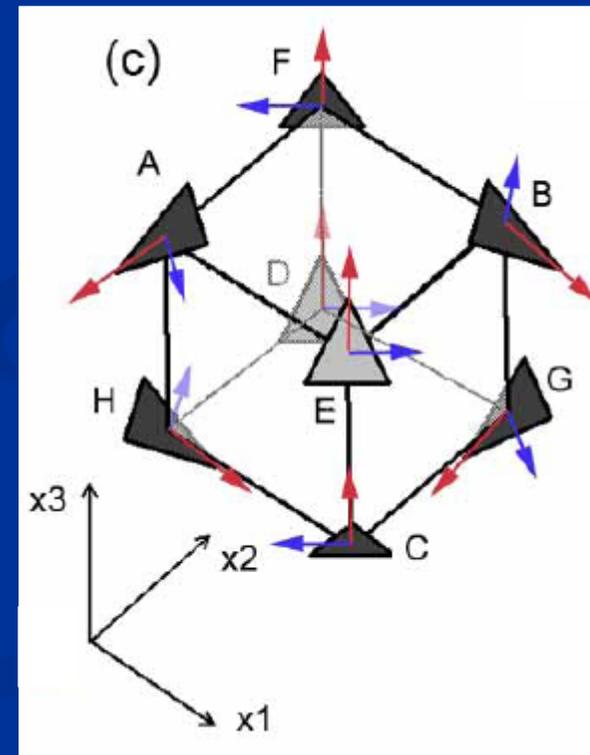

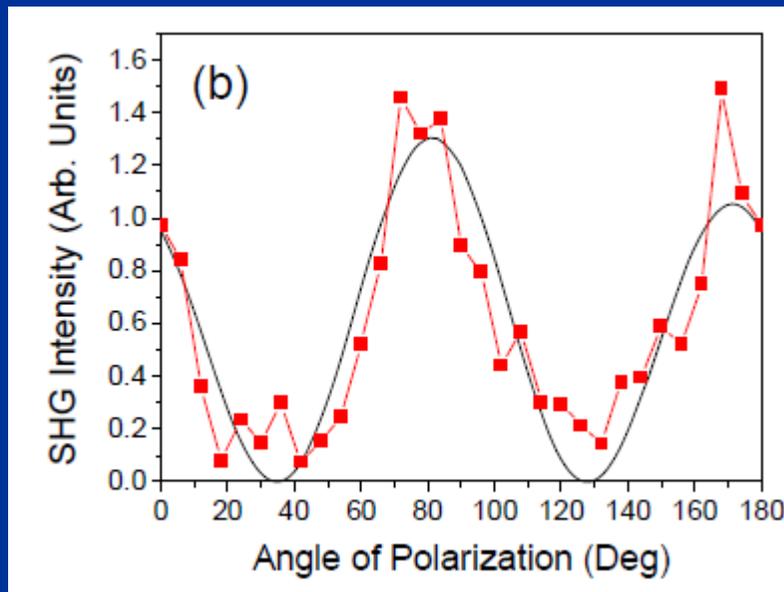

Nuclear polyhedrosis viruses in living cells

SHG to locate the virus

THG to outline the cells

# SHG polarimetry

- Body-centered-cubic arrangement of polyhedrin trimers was found from the virus

# Future prospect

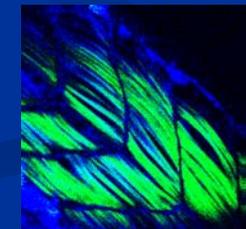

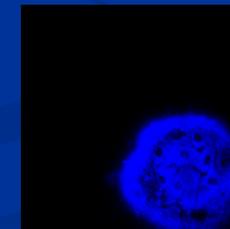

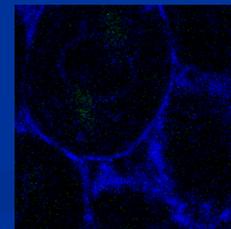

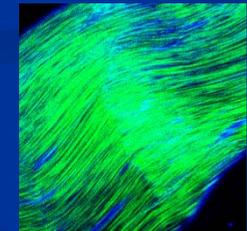

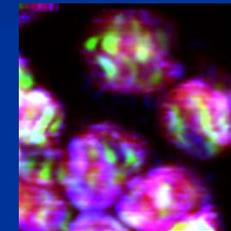

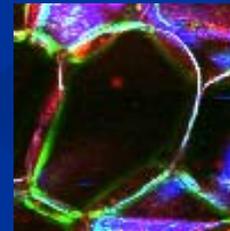

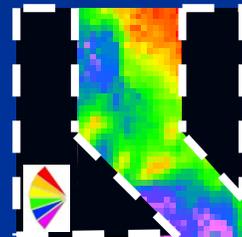

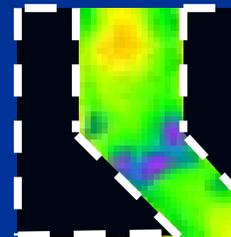

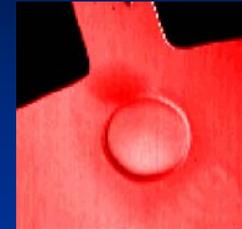

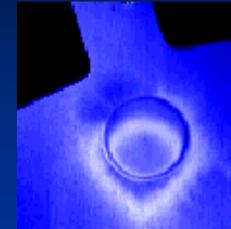

- SHG is sensitive to molecular structure
  - Membrane / thin-film study
  - Spin dynamics mapping
  - Electric field visualization
  - Thermal effect probing
  - Deep tissue imaging

# Summary for HOM

- Issues of optical microscopy
  - Contrast
    - Greatly enhanced
    - Function/structure specificity
  - Resolution
    - 300-nm for THG, 400-nm for SHG in our case
  - Penetration depth
    - > 1.5-mm
  - Noninvasiveness
    - Long-term embryonic observation
    - No exogenous labeling

# Summary for HOM

- Very good candidate for
  - Material characteristics mapping
  - E-field 3D visualization
  - Bio-photonic crystal probing
  - Developmental biology
  - And much more.....
