Coherent Radiation Sources for Small Laboratories

CW: Tunability: IR—Visible
Linewidth: 1 Hz
Power: μW —10W

Pulsed: Tunability: THz — Soft X-ray
Pulse width: ns, ps, fs
Linewidth: Transform limited
Power: up to TW for fs pulses

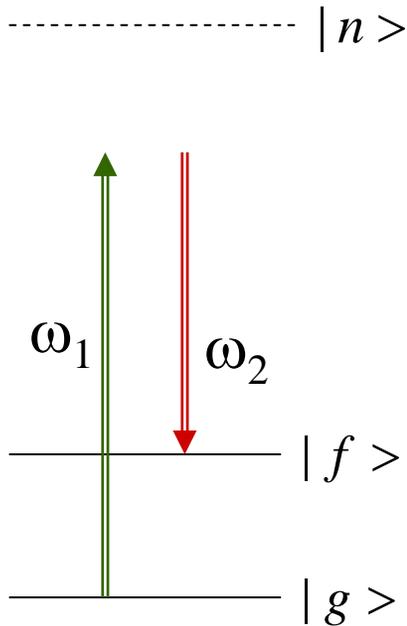

Quasi-cw: ~100 MHz mode-locked pulses
Tunability: IR — Visible
Frequency Comb: Periodic fs pulses
Spectral components with ~100 MHz spacing
and <KHz linewidth
Stable carrier/envelope phase relation

Light Scattering

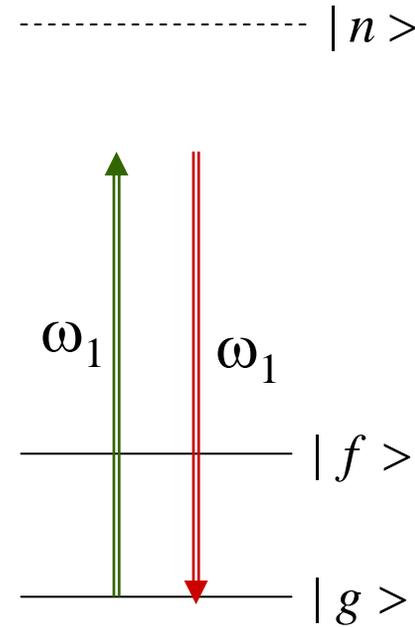

$$\frac{d\sigma}{d\Omega} \propto \frac{\omega_1 \omega_2^3}{c^4} \left| \sum_n \left[\frac{\langle f | e\vec{r} \cdot \hat{e}_1 | n \rangle \langle n | e\vec{r} \cdot e_2 | g \rangle}{\omega_1 - \omega_{ng}} - \frac{\langle f | e\vec{r} \cdot \hat{e}_1 | n \rangle \langle n | e\vec{r} \cdot e_2 | g \rangle}{\omega_2 + \omega_{ng}} \right] \right|^2$$

Raman Scattering

Rayleigh Scattering

$$S = N \frac{d\sigma}{d\Omega} \Delta\Omega (I / \hbar\omega) V \quad \text{photons/sec}$$

Estimates of Signal Strength

$$\frac{d\sigma}{d\Omega} \equiv \frac{\text{Scattered \#photons in } d\Omega \text{ per sec}}{\text{Incoming photon intensity}}$$

$$N \left(\frac{d\sigma}{d\Omega} \right)_{Raman} \sim 10^{-8} \text{ cm}^{-1}$$

$$N \left(\frac{d\sigma}{d\Omega} \right)_{Rayleigh} \sim 10^{-6} \text{ cm}^{-1}$$

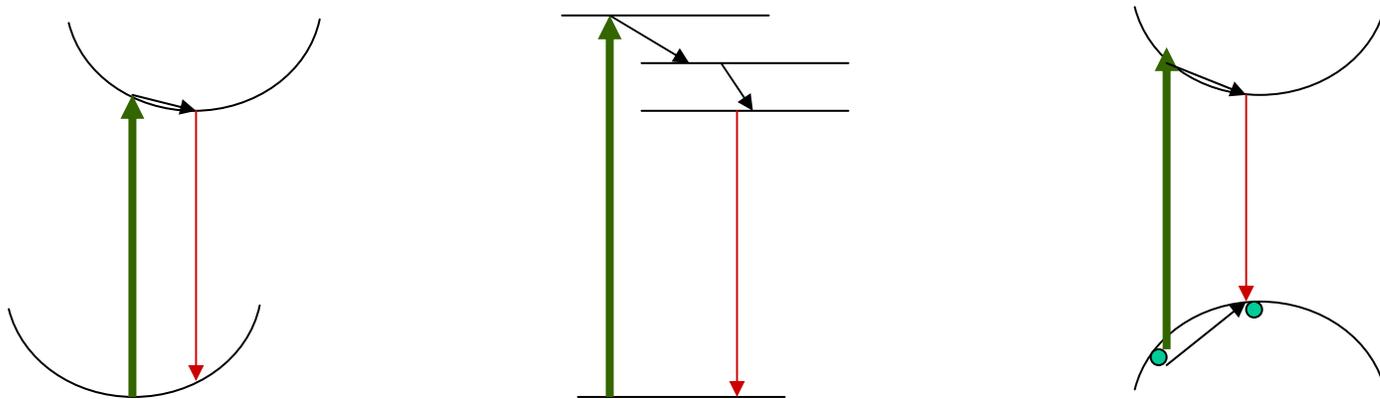

For a 1-mW beam focused to a spot of $10 \times 10 \times 10 \text{ } \mu\text{m}^3$,

$$(I / \hbar\omega)V \sim 10^{15} \text{ photons/sec}$$

$$S_{Raman} \sim 10^7 \Delta\Omega \text{ photons/sec}$$

$$S_{Rayleigh} \sim 10^9 \Delta\Omega \text{ photons/sec}$$

Luminescence/Fluorescence

$$\sigma_L = \sigma_{abs} \eta_R \frac{\text{Rate of lum. trans.}}{\text{Total decay rate}} = \sigma_{abs} \eta_R R_L T_1$$

$$\beta = \text{absorption coefficient} = N \sigma_{abs}$$

$$\frac{\text{\#Photons emitted}}{\text{\#Photons absorbed}} = \eta_R R_L T_1$$

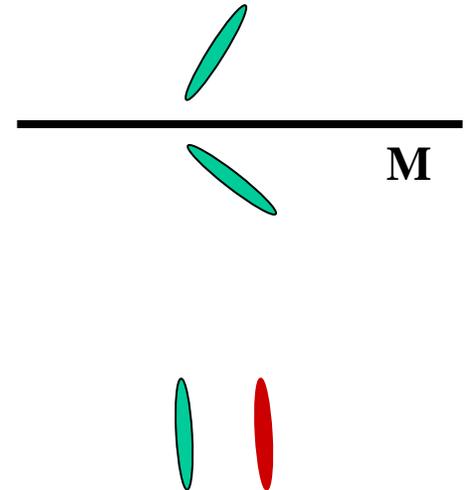

Luminescence >> Rayleigh Scattering
(Single Molecule Detection)

Fluorescence Quenching

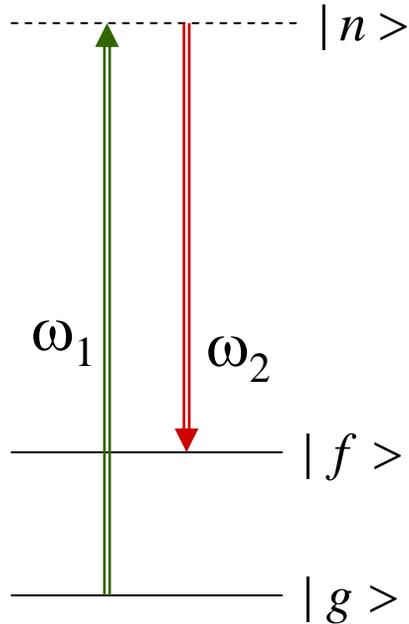

$$\text{Intermolecular Interaction} = C / R^6$$

Excitation energy transferred to neighbors through interactions:

- Fluorescence quenching of molecules on metals
- Fluorescence resonance energy transfer (FRET) between molecules

Resonant Light Scattering & Hot Luminescence

$$\left(\frac{d\sigma}{d\Omega}\right)_{Raman} \propto \frac{\omega_1 \omega_2^3}{c^4} \left| \sum_n \frac{\langle f | e\vec{r} \cdot \hat{e}_1 | n \rangle \langle n | e\vec{r} \cdot e_2 | g \rangle}{\omega_1 - \omega_{ng} + i/T_2} \right|^2$$

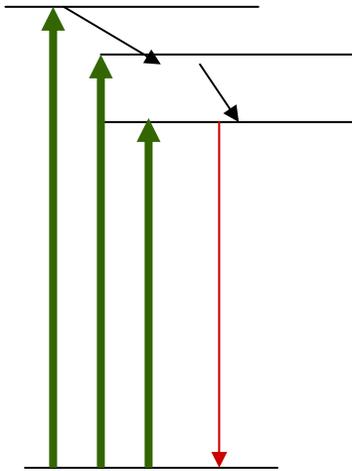

$$\sigma_L = \sigma_{abs} \frac{\text{emission rate}}{\text{total decay rate}}$$

$$\propto |\langle n | e\vec{r} \cdot \hat{e}_1 | g \rangle|^2 T_2 |\langle f | e\vec{r} \cdot e_2 | n \rangle|^2 T_1$$

Resonant enhancement of scattering:

$$\eta_{sc} \sim \left| \frac{1/T_2}{\omega - \omega_{ng}} \right|^2 \sim 100 \quad \text{if} \quad 1/T_2 \sim 10^3 \text{ cm}^{-1}, \quad \omega - \omega_{ng} \sim 10^4 \text{ cm}^{-1}$$

Excitation Spectrum

$$\sigma_L = \sigma_{abs} \eta_R \frac{\text{emission rate}}{\text{Total decay rate}}$$

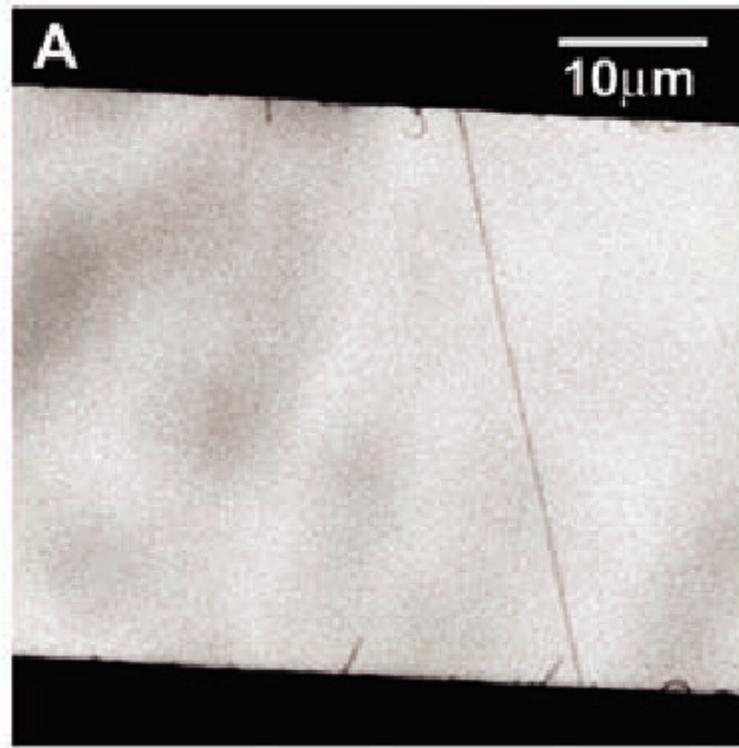

$$\propto \sigma_{abs}$$

$$\sigma_{Rayleigh} \propto \left| \sum_n \frac{\langle f | e\vec{r} \cdot \hat{e}_1 | n \rangle \langle n | e\vec{r} \cdot \hat{e}_2 | g \rangle}{\omega_1 - \omega_{ng} + i/T_{2,ng}} \right|^2$$

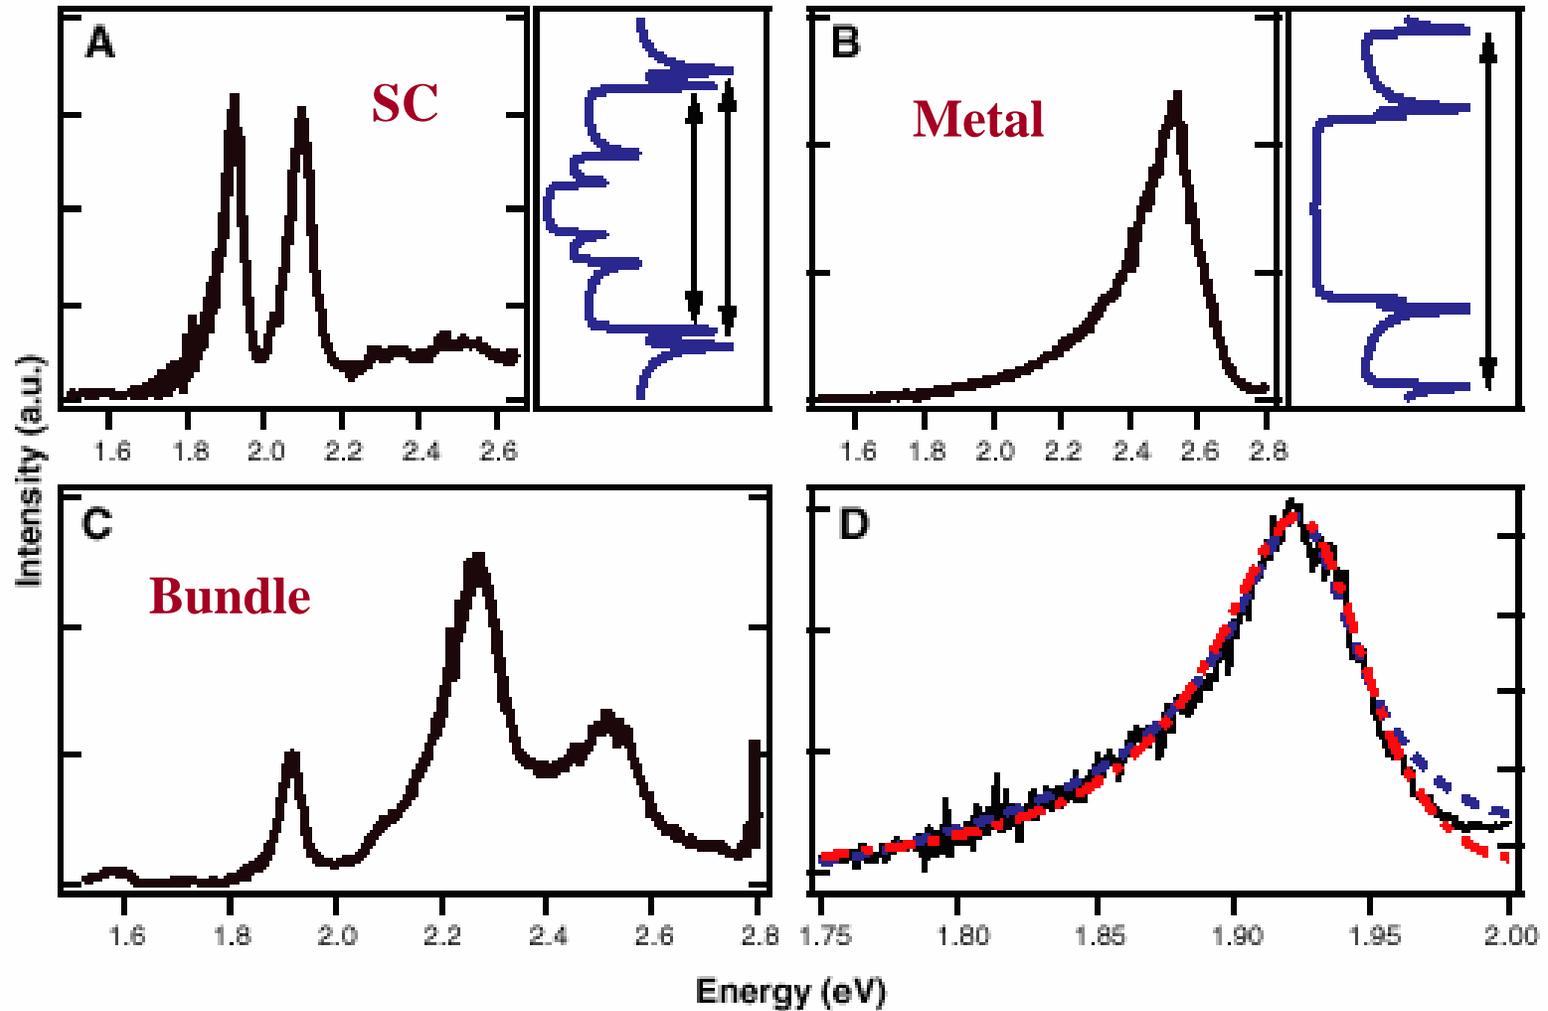

Resonant enhancement in σ_L or $\sigma_{Rayleigh}$ yields the excitation spectrum

$\Rightarrow\Rightarrow$ A sensitive method to obtain absorption spectrum

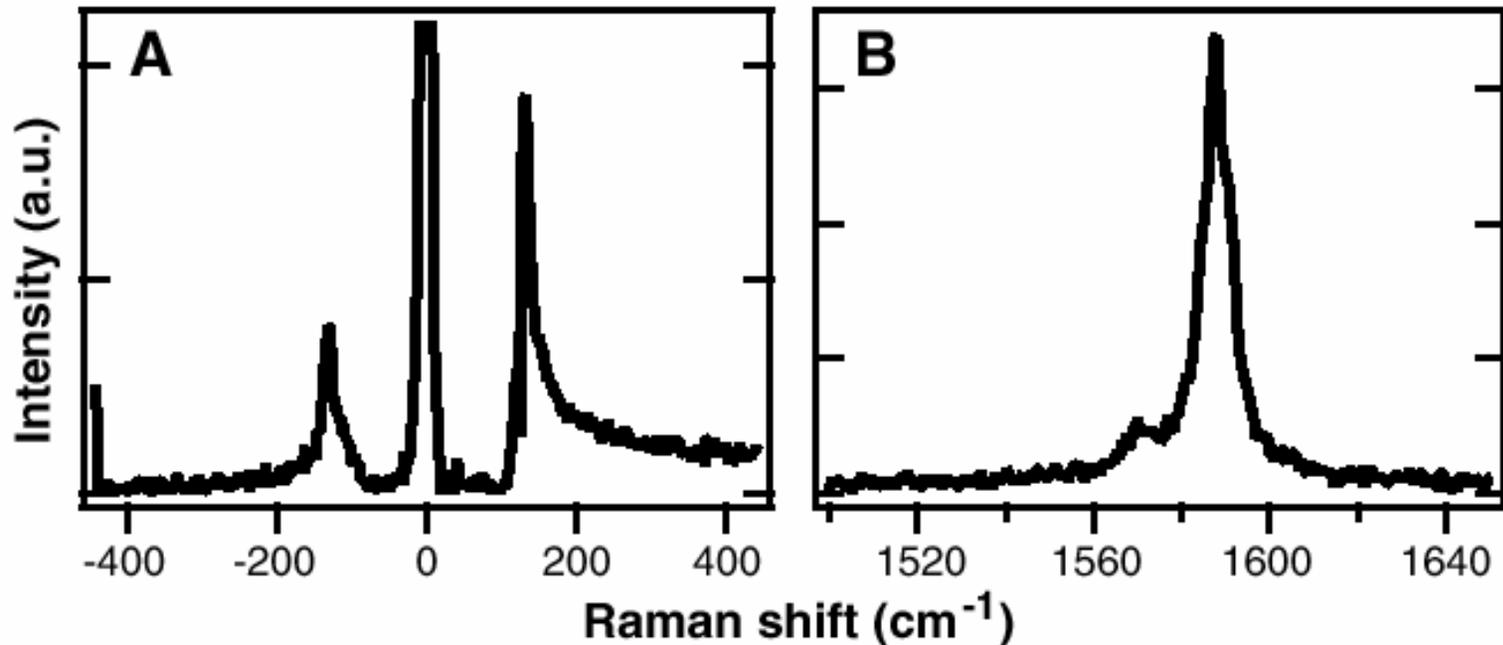

A Single Carbon Nanotube

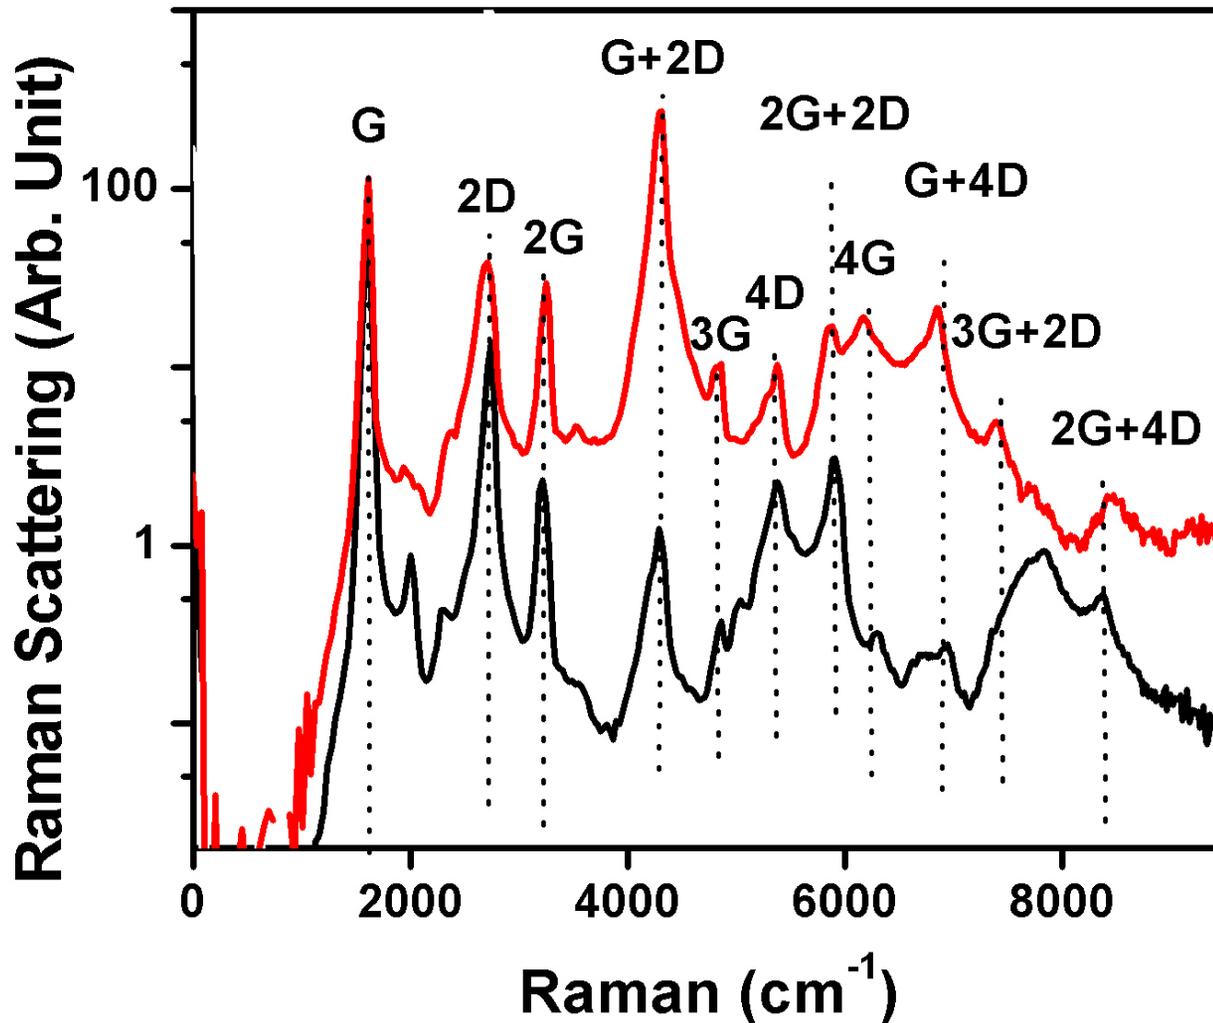

Excitation Spectra of Rayleigh Scattering of Carbon Nanotubes

Resonance Raman Scattering from Single-Wall Carbon Nanotubes

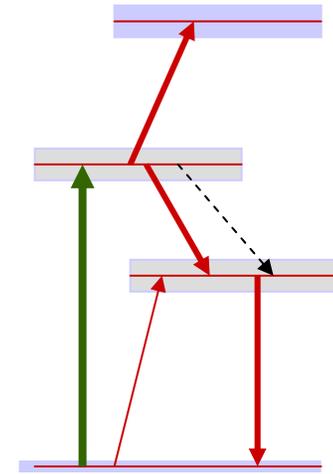

Multi-Phonon Raman Scattering from Single SW Carbon Nanotubes

Labeling Spectroscopy

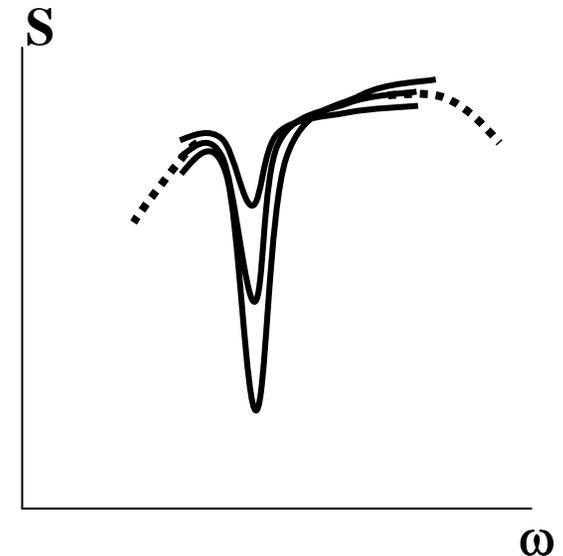

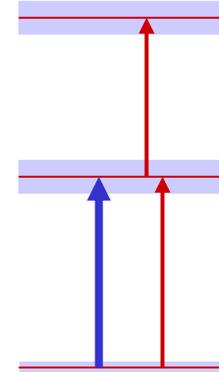

- **Elimination or reduction of inhomogeneous broadening**
- **Selective detection or probe of species in an ensemble**
- **Studies of interactions and energy transfer between neighbors**

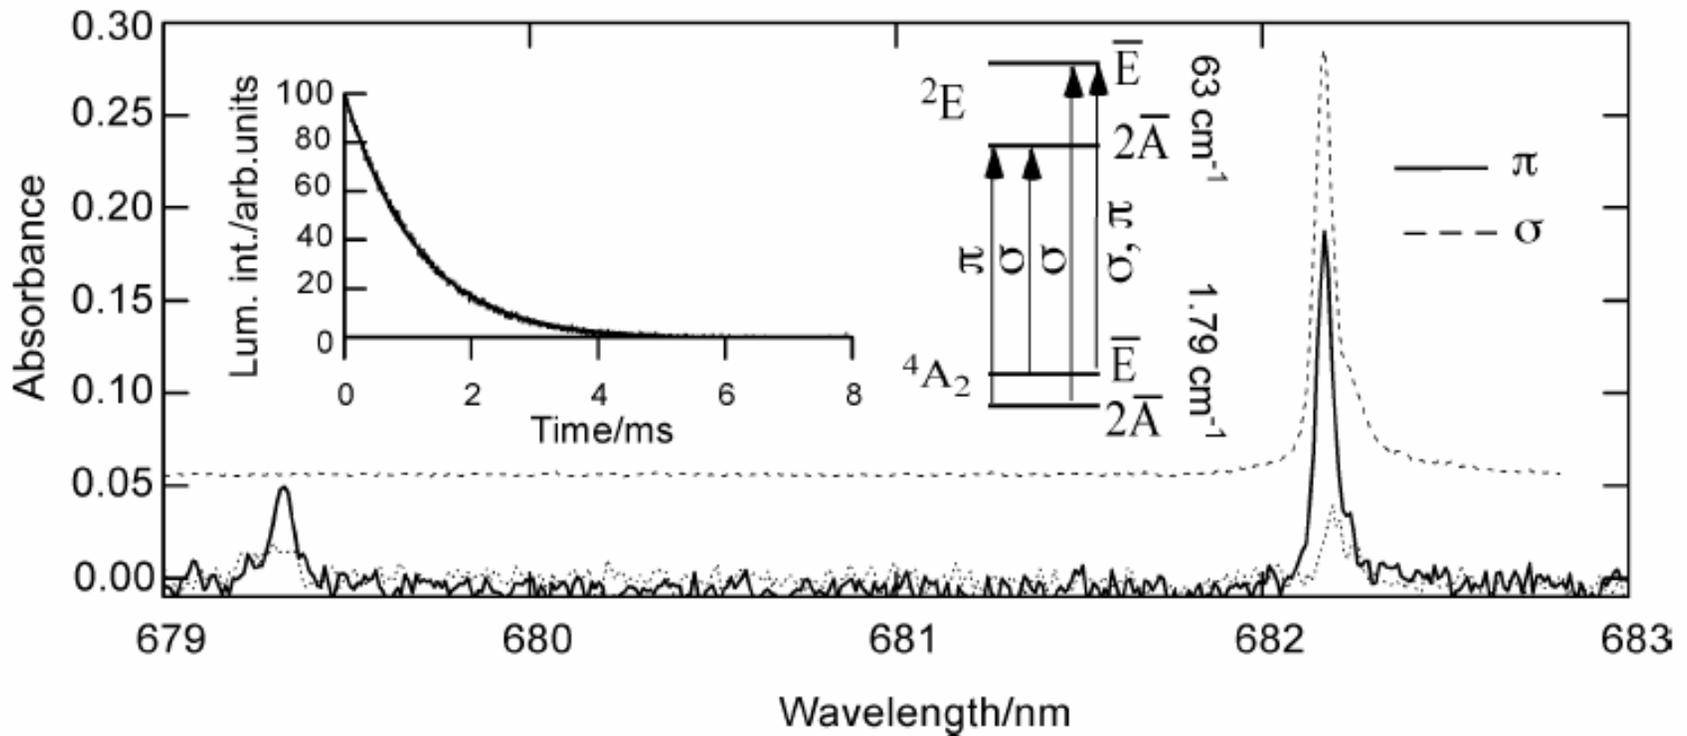

Examples: Carbon nanotubes
Semiconductor nanoparticles

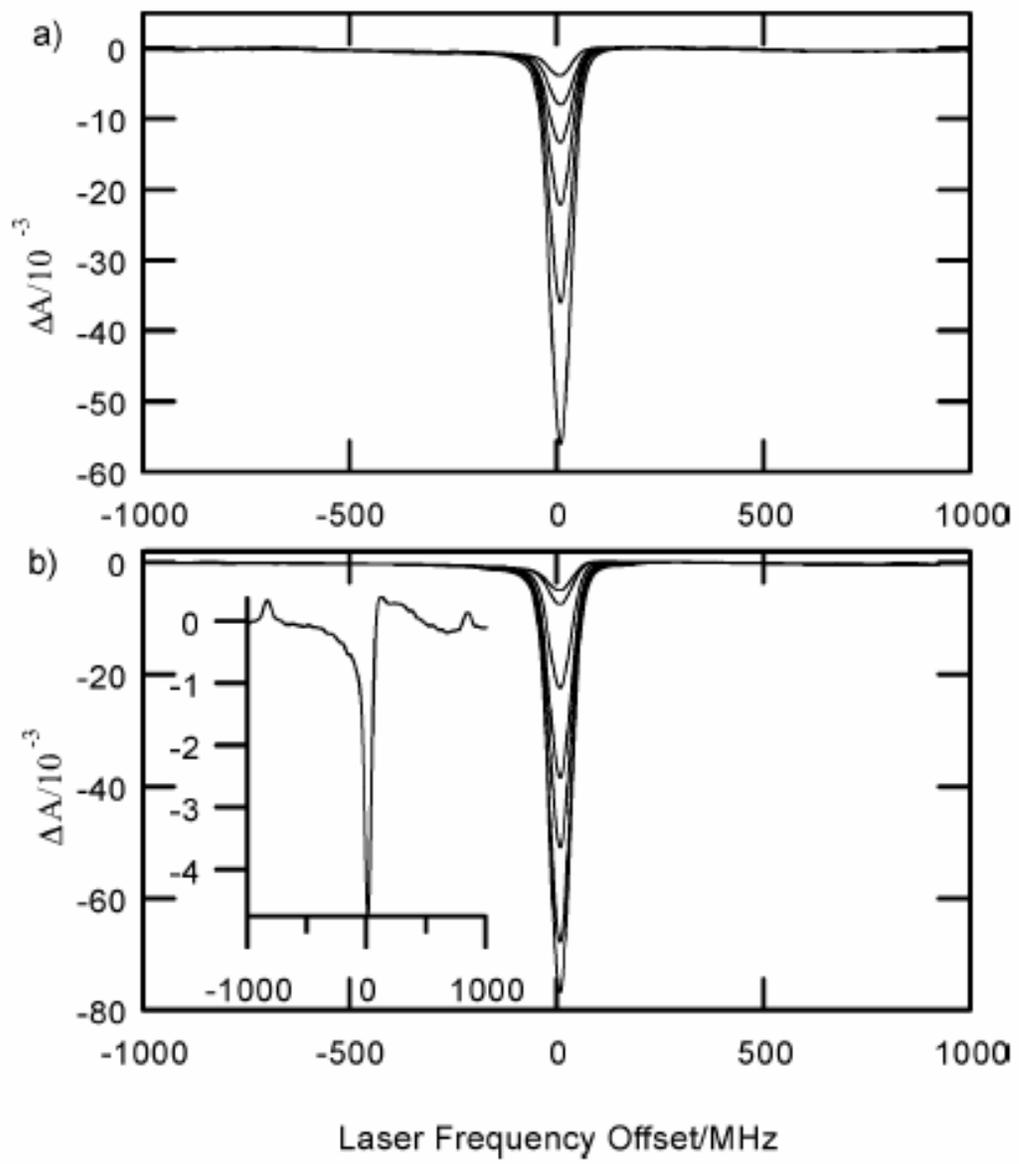

Spectral Hole Burning

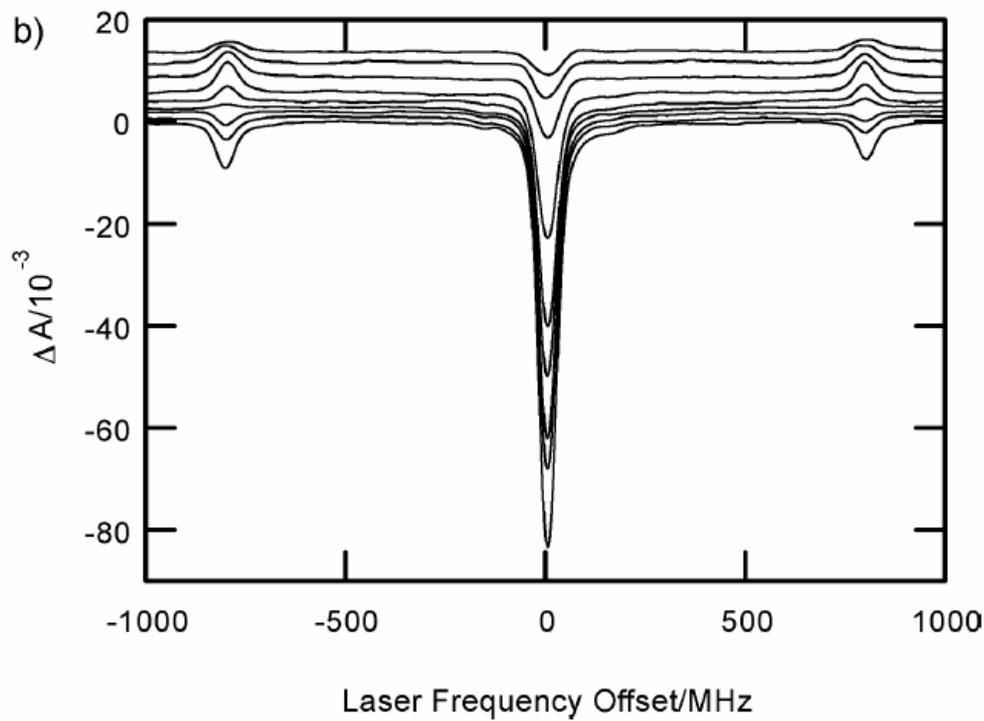

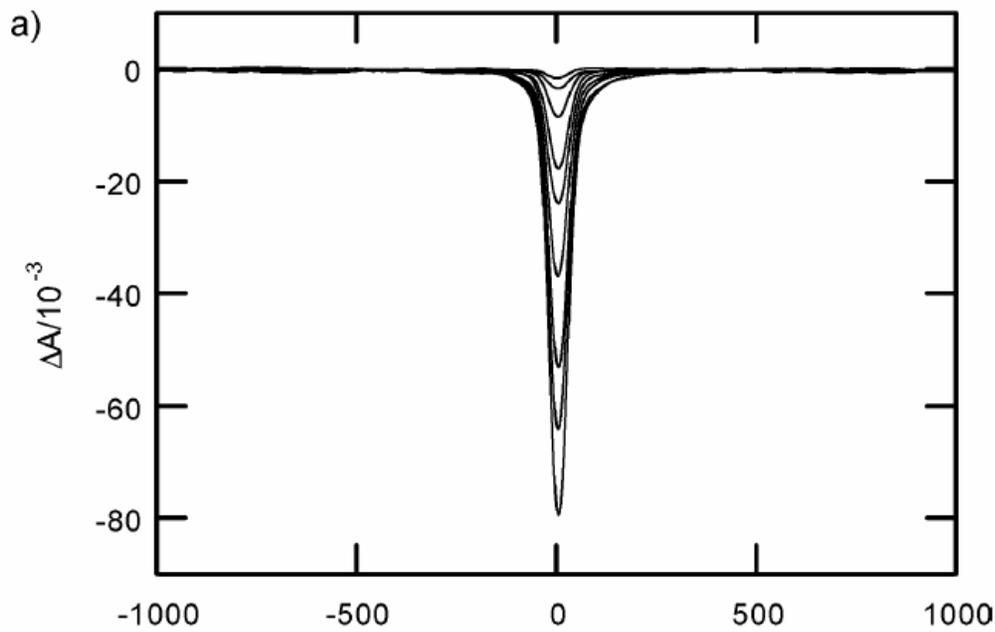

- hole width \sim homogeneous linewidth
= $1/\text{dephasing time}$
- hole recovery time
 \sim population relaxation time
- hole broadening with time
 \sim excitation transfer to neighbors
(spectral diffusion)

Absorption Spectra of $\text{Be}_3\text{Al}_2\text{Si}_6\text{O}_{18}:\text{Cr}$ (Emerald) at 2.5K

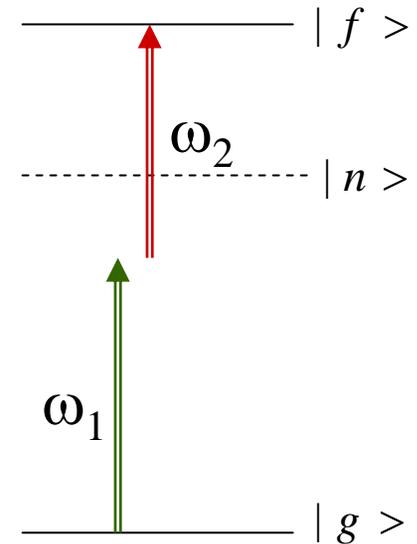

Multi-Photon Excitation

Multi-photon absorption

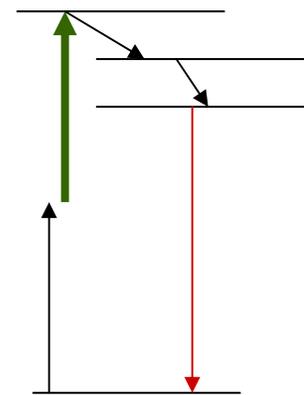

$$\sigma_{abs}^{(2)} \propto \left| \sum_n \left[\frac{\langle f | e\vec{r} \cdot \hat{e}_1 | n \rangle \langle n | e\vec{r} \cdot e_2 | g \rangle}{\omega_1 - \omega_{ng}} + \frac{\langle f | e\vec{r} \cdot \hat{e}_1 | n \rangle \langle n | e\vec{r} \cdot e_2 | g \rangle}{\omega_2 - \omega_{ng}} \right] \right|^2$$

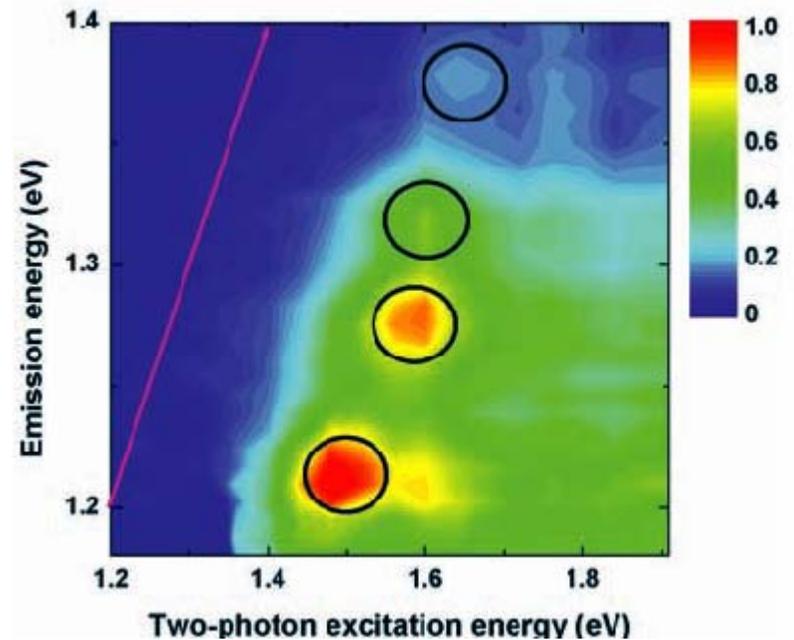

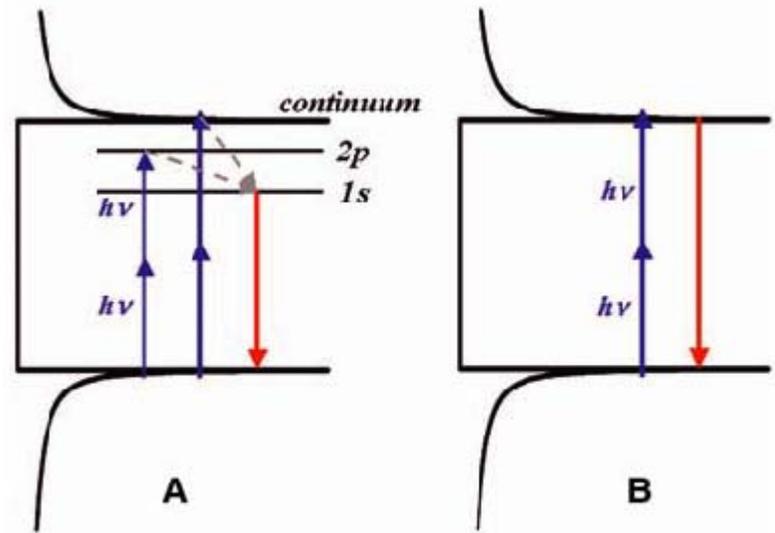

Multi-photon-excited Luminescence

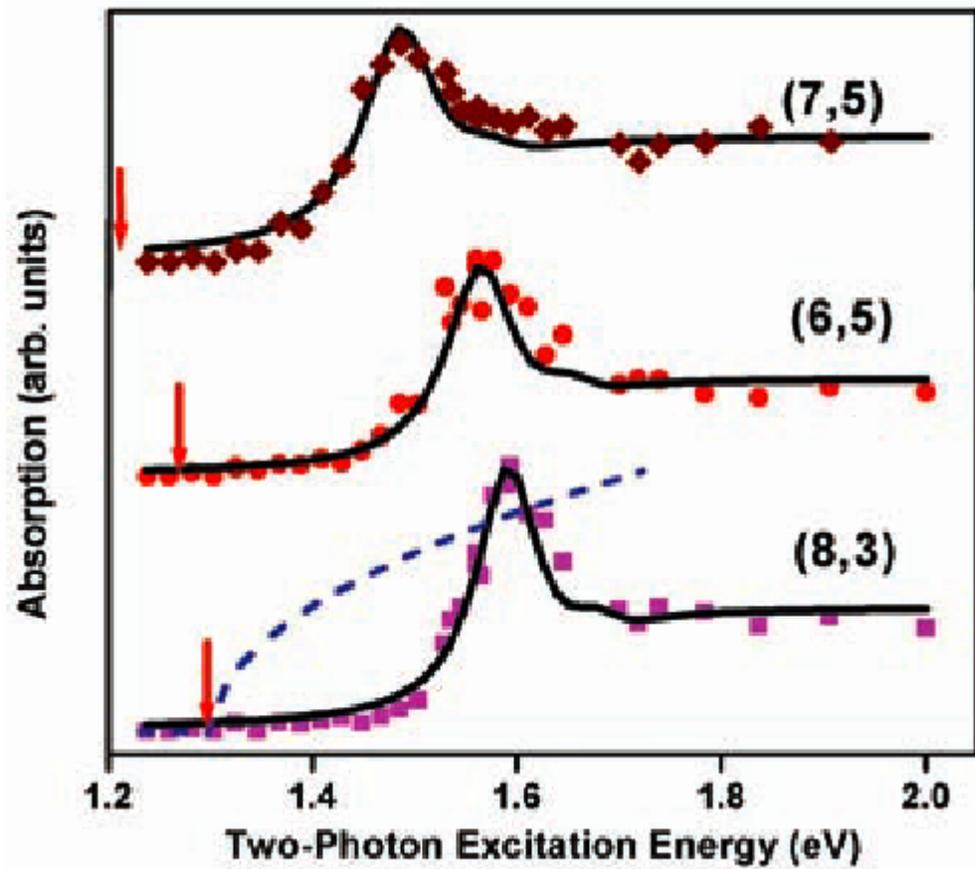

$$\sigma_L^{(2)} = \sigma_{abs}^{(2)} \eta_R \frac{\text{Rate of lum. trans.}}{\text{Total decay rate}} = \sigma_{abs}^{(2)} \eta_R R_L T_1$$

$$\frac{\# \text{Photons emitted}}{\# \text{Photons absorbed}} = \eta_R R_L T_1$$

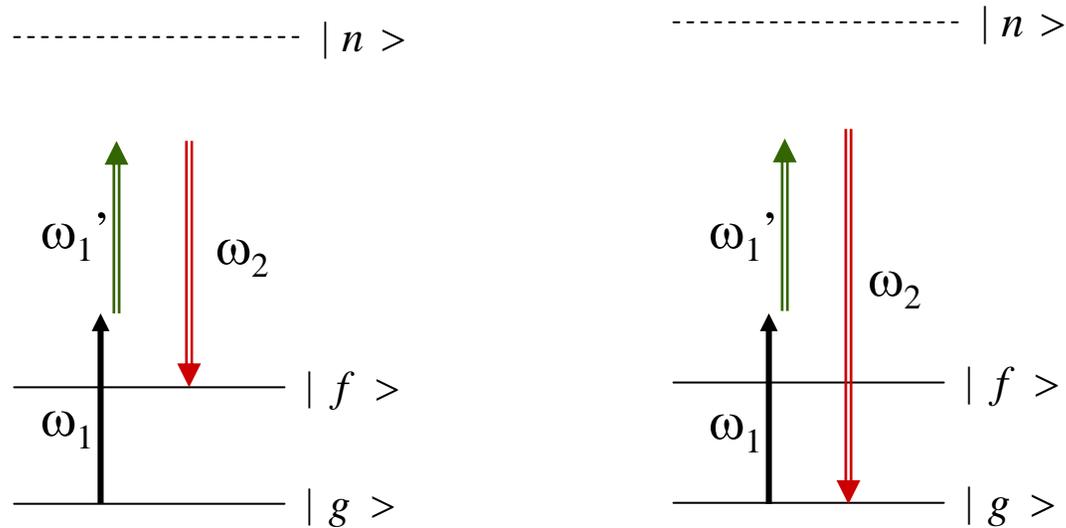

Two-Photon Excitation Spectra of Single-Wall Carbon Nanotubes

Hyper-Light Scattering

$$\frac{d\sigma}{d\Omega} \propto \left| \sum_{n,n'} \left[\frac{\langle f | e\vec{r} \cdot \hat{e}_2 | n' \rangle \langle n' | e\vec{r} \cdot \hat{e}_1 | n \rangle \langle n | e\vec{r} \cdot \hat{e}_1 | g \rangle}{(\omega_1 - \omega_{ng})(\omega_1 + \omega_1' - \omega_{ng})} + \dots \right] \right|^2$$

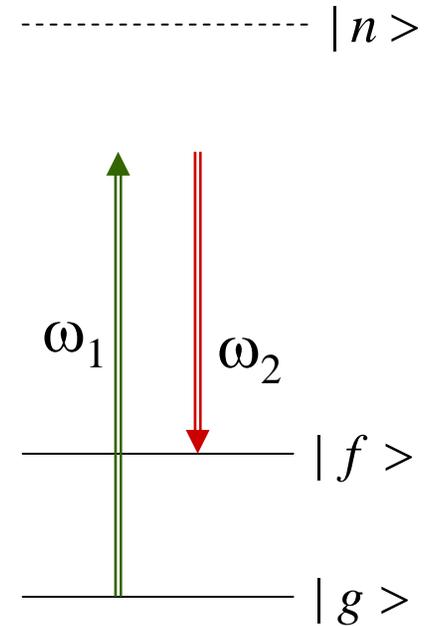

Stimulated Raman Spectroscopy

$$\frac{dn_2}{dz} = -\frac{dn_1}{dz} = \gamma n_1 (n_2 + 1)$$

$$\approx \gamma n_1 n_2$$

$$n_2 = n_{20} e^{\gamma n_1 z} \approx n_{20} (1 + \gamma n_1 z)$$

$$\text{Raman Gain} = \gamma n_1 \propto N \frac{d\sigma}{d\Omega} \frac{1}{\Gamma} n_1$$

For $N \frac{d\sigma}{d\Omega} \sim 10^{-8} / \text{cm}$ and $\Gamma \sim 1 \text{ cm}^{-1}$,

$$\gamma \sim 10^{-3} \text{ cm/MW}$$

$$\text{Gain} \sim 1 \text{ cm}^{-1} \text{ for } I_1 = n_1 \hbar \omega_1 c \sim 1 \text{ GW/cm}^2$$

Estimate of Detection Limit

Consider a 100-fs input pulse at ω_1 with 0.1 $\mu\text{J}/\text{pulse}$,
focused to a 10 μm spot: $I \sim 10^{12} \text{ W}/\text{cm}^2$

$$\frac{\Delta n_2}{n_{20}} = \frac{\Delta I_2}{I_{20}} \approx (\text{Gain})z, \quad \text{Gain} = \gamma n_1 \propto [N(d\sigma / d\Omega) / \Gamma] n_1$$

$$\text{detectable } [(\text{Gain})z]_{\min} \sim 10^{-6}.$$

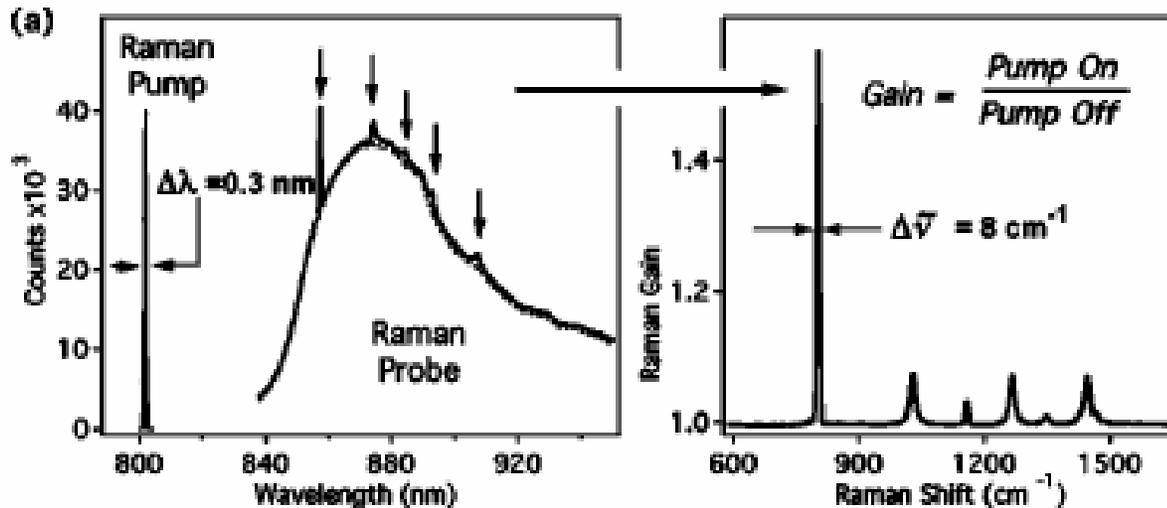

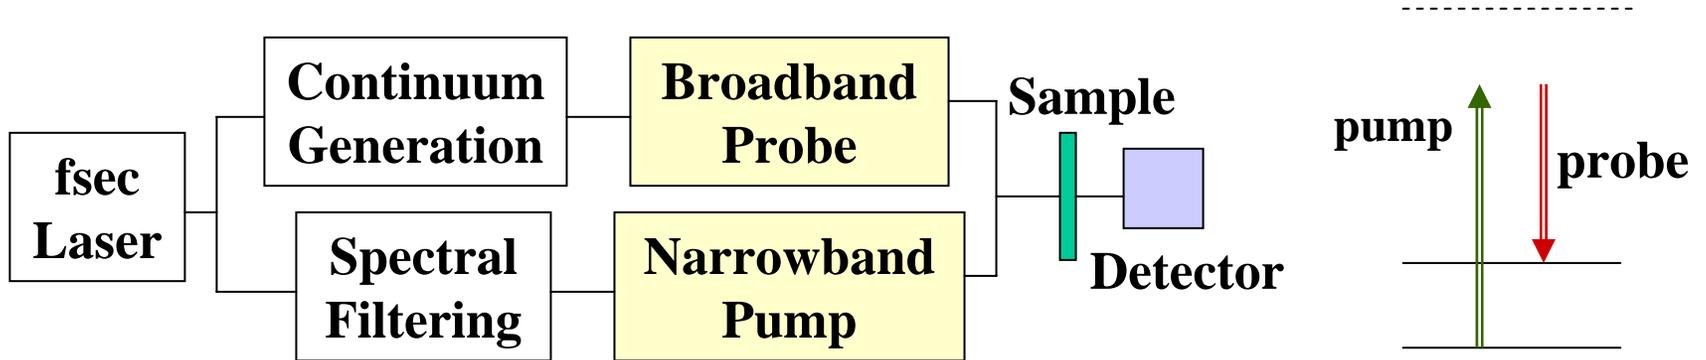

With $z \sim 1 \text{ mm}$ and $I \sim 10^{12} \text{ W}/\text{cm}^2$,

$$\text{detectable } \gamma_{\min} \sim 10^{-11} \text{ cm}/\text{MW}$$

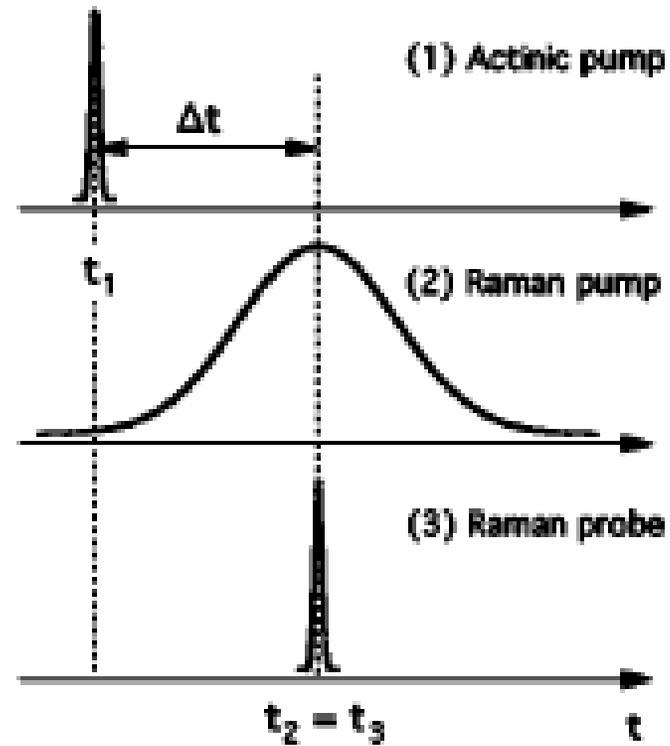

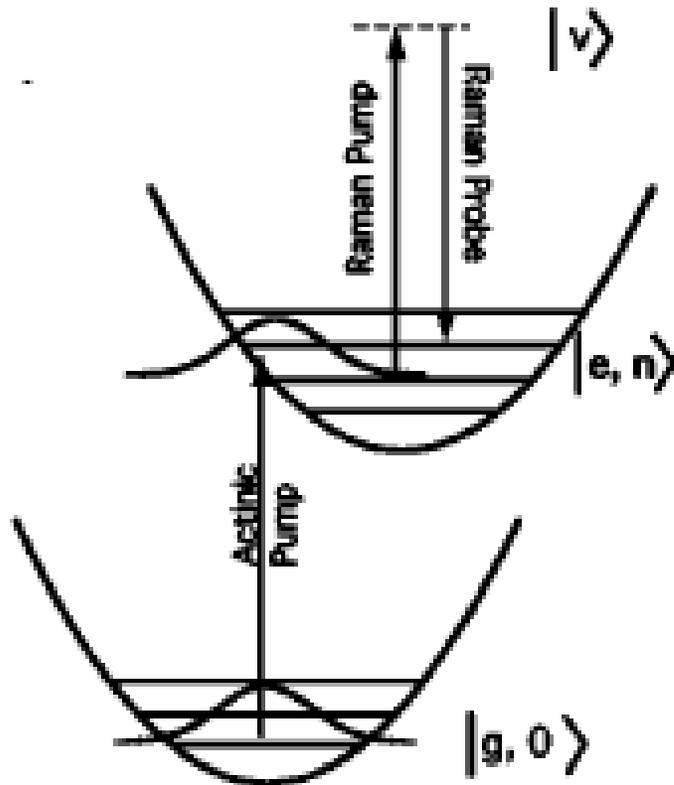

$$\text{or } [N(d\sigma / d\Omega) / \Gamma]_{\min} \sim 10^{-16} / \text{cm}$$

as compared to typical $N(d\sigma / d\Omega) / \Gamma \sim 10^{-8} / \text{cm}$

Experimentals

Probing Vibrations in Excited Electronic Configurations

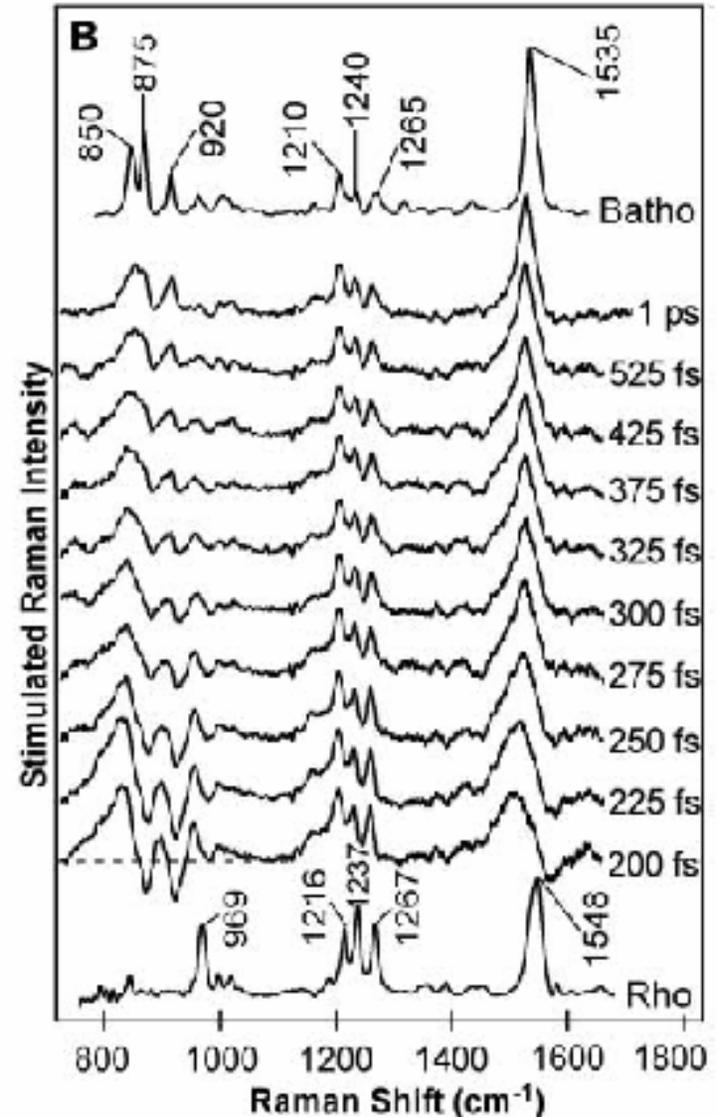

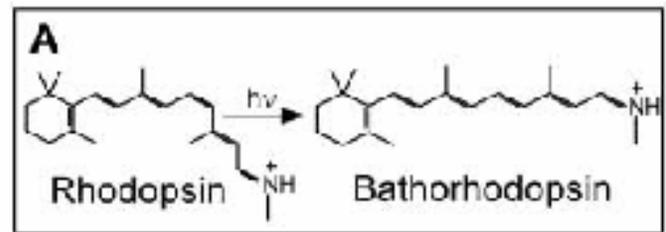

Merits:

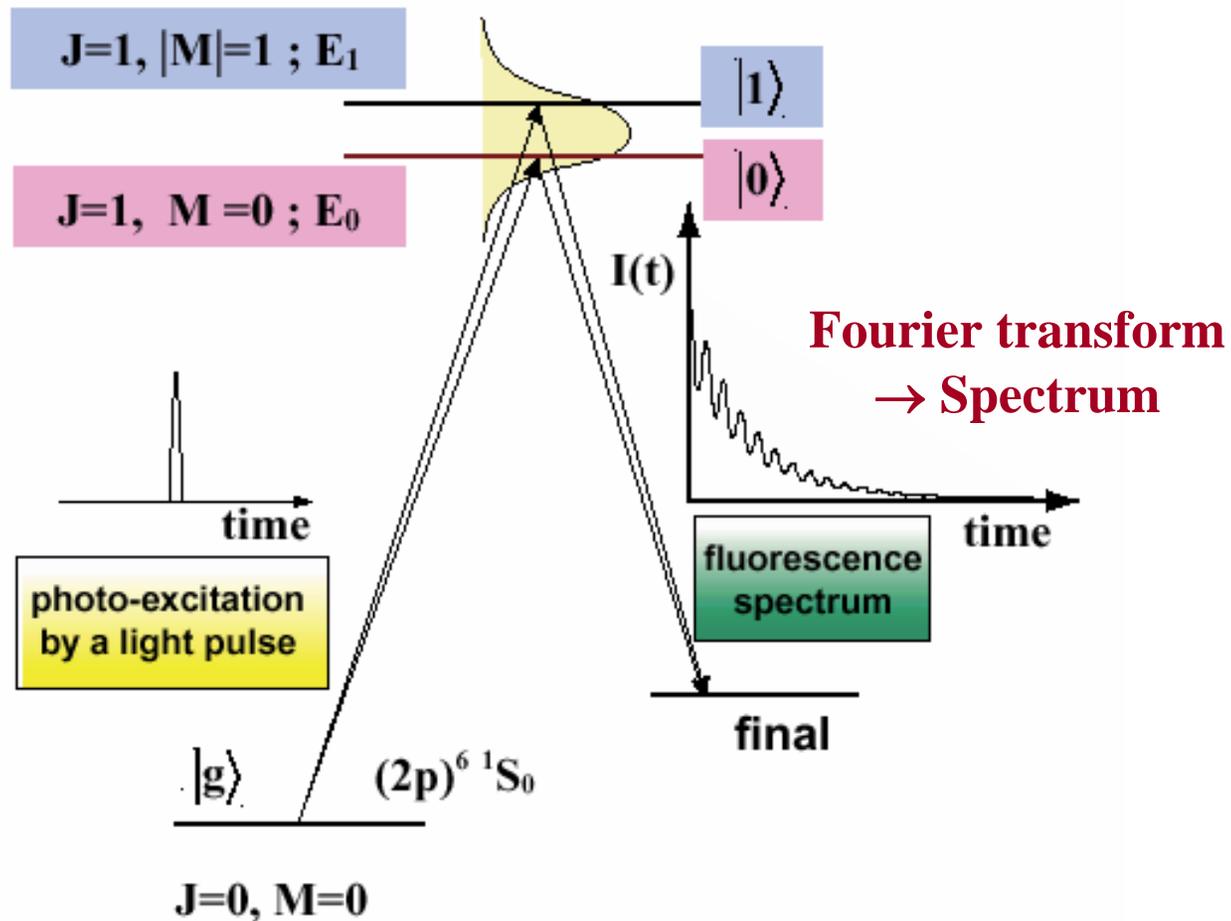

- **Background elimination**
- **Fluorescence rejection (making resonant Raman studies possible)**
- **Fast data collection (pump intensity, $\sim 1 \text{ GW/cm}^2$; path length, $\sim 3 \text{ mm}$; SNR ~ 2 with single shot)**
- **Ultrafast time resolution ($\sim 100 \text{ fs}$)**
- **Reasonable spectral resolution ($< 10 \text{ cm}^{-1}$)**
- **Capable of probing transient vibrational modes in the excited electronic configurations**

Example:

Light-Induced cis-trans Isomerization of Retinal in Rhodopsin

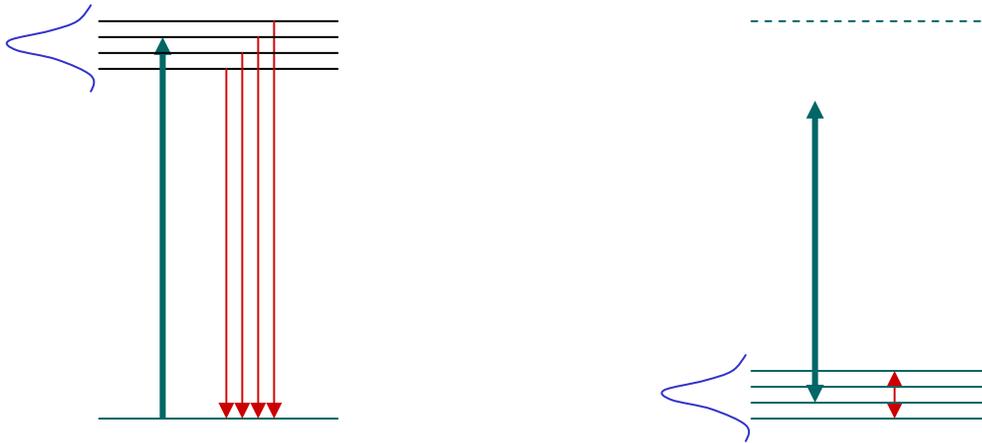

Quantum Beats (resulting from pulse excitation)

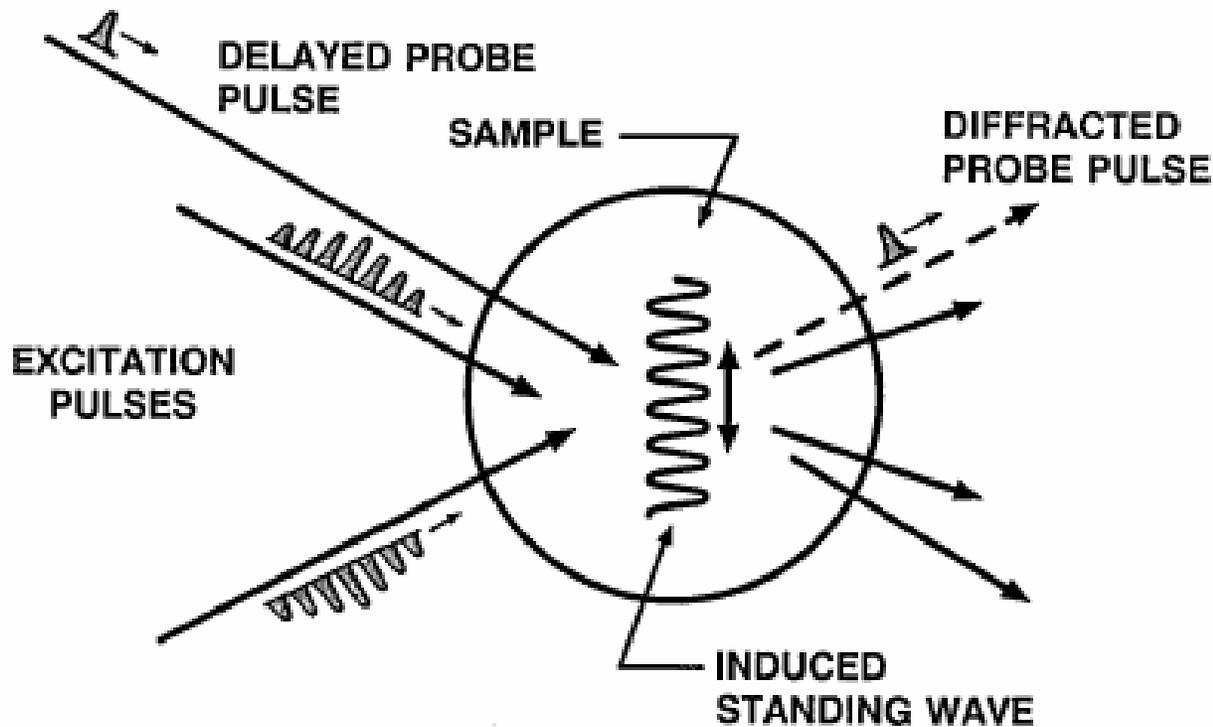

Impulsive Excitations

100-fs pulse \Leftrightarrow $\sim 300 \text{ cm}^{-1}$ spectral width

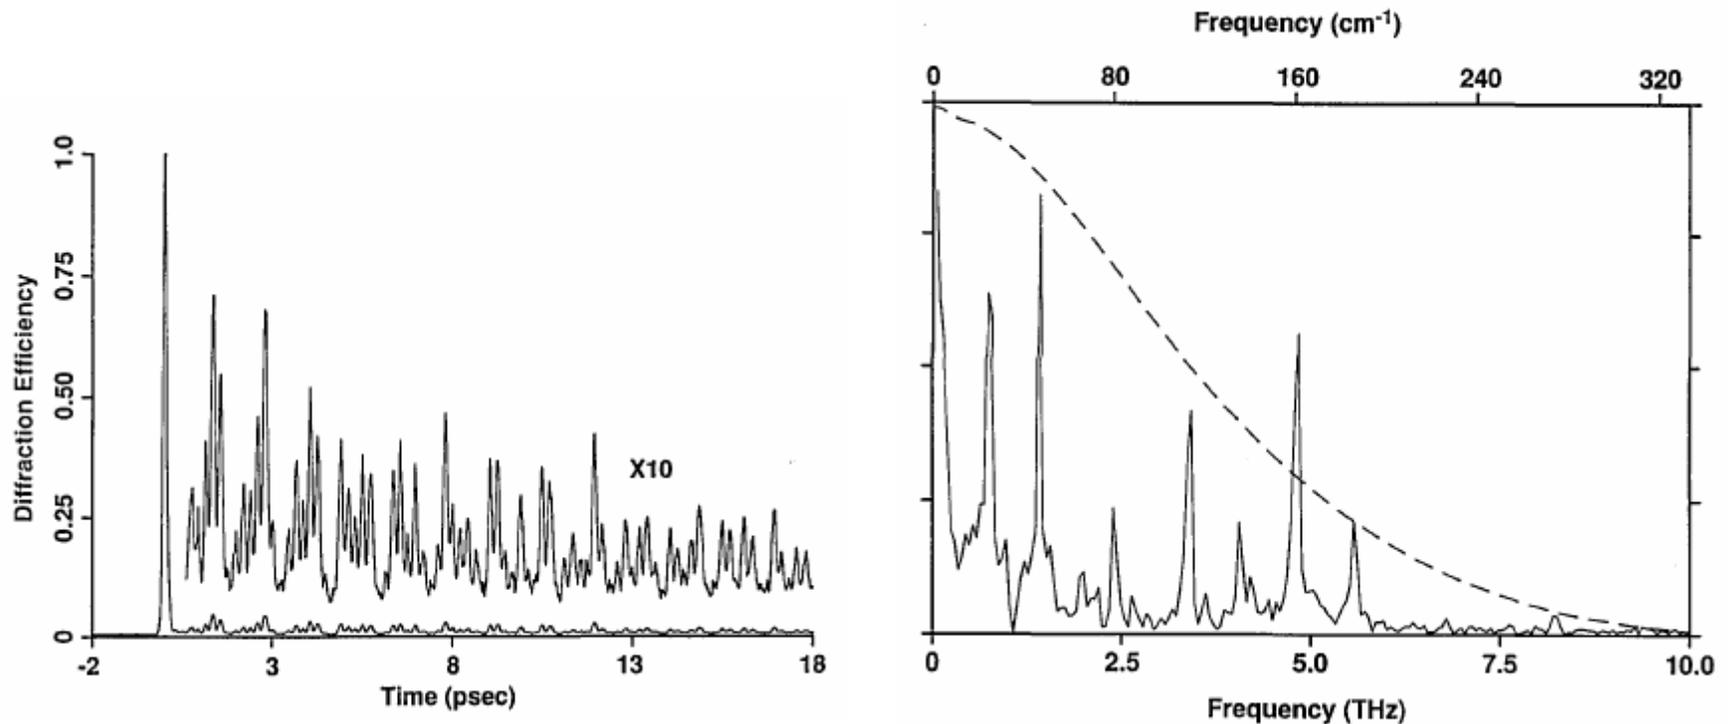

fs pulse sets up coherent excitations in a set of excited states. Signal appears as oscillation on the fs time scale. Fourier transform of the time-dependent signal yields the spectrum.

Time-Resolved Impulsive Raman Spectroscopy

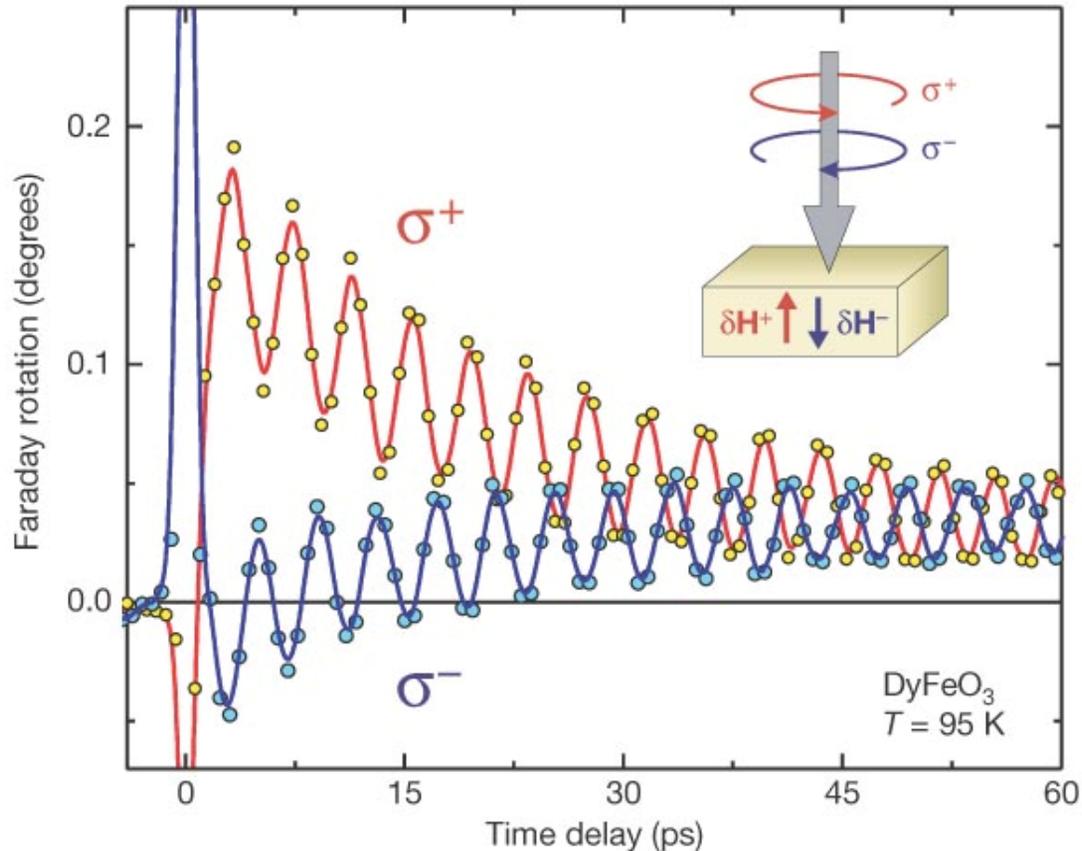

Impulsive Stimulated Raman Spectroscopy: Perylene Crystal

Time-Resolved Impulsive Spectroscopy

- **Molecular vibrations**
- **Phonons**
- **Plasmons**
- **Phonon-plasmons**
- **Magnons (spin waves)**
- **Other elementary excitations**

Impulsive Spin Excitations in DyFeO₃

Detection by Faraday Rotation

$$\theta_F \propto M_z = Ae^{-\gamma t} + Be^{-\gamma' t} \cos \omega t$$

**Optical field induces
magnetization?**

Optical Rectification & Optical-Field-Induced Magnetization

Time-averaged Free Energy:

$$F = F_0(H_{dc}) - \sum_{i,j} \chi_{ij}^{(1)}(H_{dc}) E_i^*(\omega) E_j(\omega) \quad [\approx -(\gamma_{+0} - \gamma_{-0}) H_{dc,z} (|E_+(\omega)|^2 - |E_-(\omega)|^2) / 2]$$
$$- \sum_{i,j,k} \chi_{ijk}^{(2)} E_{dc,i} E_j^*(\omega) E_k(\omega) + \dots$$

Induced dc polarization:

$$P_{dc,i} = -\frac{\partial F}{\partial E_{dc,i}} = \sum_{j,k} \chi_{ijk}^{(2)} E_j^*(\omega) E_k(\omega)$$

Induced dc magnetization:

$$\Delta M_{dc,z} = -\frac{\partial F}{\partial H_{dc,z}} = (\gamma_{+0} - \gamma_{-0}) (|E_+(\omega)|^2 - |E_-(\omega)|^2) / 2$$

Optical-Field-Induced Magnetization

$$\Delta F = -(\gamma_{+0} - \gamma_{-0})H_{dc,z}(|E_+(\omega)|^2 - |E_-(\omega)|^2)/2 = -\Delta M_z H_{dc,z}$$

$$\Delta M_{+z} = (\gamma_{+0} - \gamma_{-0})|E_+(\omega)|^2 = \chi_H H_{eff}$$

$$H_{eff} = [(\gamma_{+0} - \gamma_{-0}) / \chi_H] |E_+(\omega)|^2$$

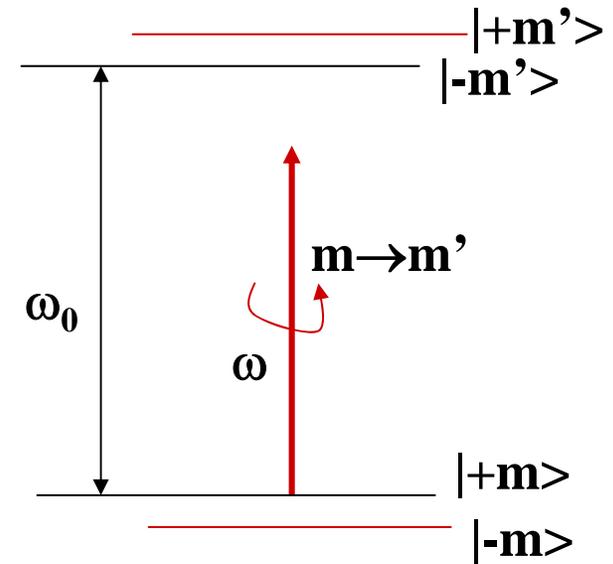

For $|E_+(\omega)|^2 \sim 10^8$ esu (2.5×10^{10} W/cm²),

$(\gamma_{+0} - \gamma_{-0}) \sim 10^{-8}$ /gauss ($\sim 0.1^0$ / gauss-cm),

and $\chi_H \sim 10^{-4}$ emu (at $T = 30K$),

$H_{eff} \sim 10^4$ gauss (fs pulse of magnetic field)

Physical Interpretation (AC Stark Effect)

$$\Delta E_{g,\pm m} = \sum_n \left[\frac{|\langle n | e\vec{r} \cdot \vec{E}(\omega) | g, \pm m \rangle|^2}{\hbar(\omega - \omega_{ng,\pm m})} - \frac{|\langle n | e\vec{r} \cdot \vec{E}^*(\omega) | g, \pm m \rangle|^2}{\hbar(\omega + \omega_{ng,\pm m})} \right]$$

$$M = -Ng_J\beta \langle J_z \rangle$$

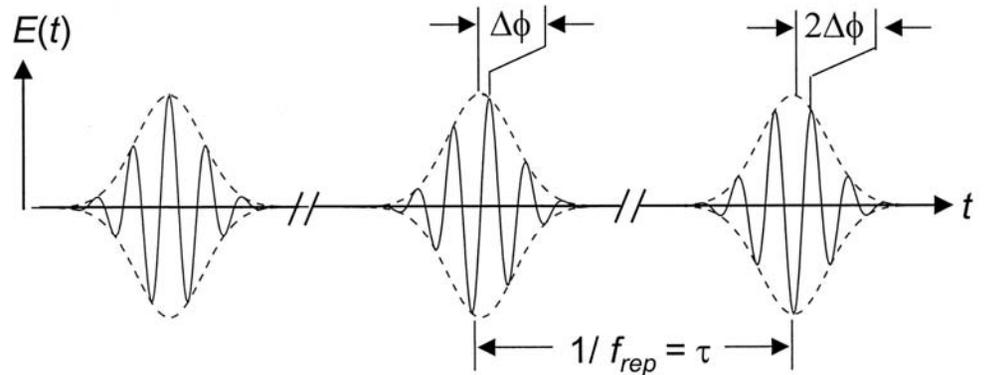

$$= -Ng_J\beta [\langle m | J_z | m \rangle \rho_m + \langle -m | J_z | -m \rangle \rho_{-m}]$$

Frequency Comb

$$E(t) = A(t) \cos[2\pi ft + (\Delta\phi / \tau)t]$$

$$A(t) = A(t + \tau)$$

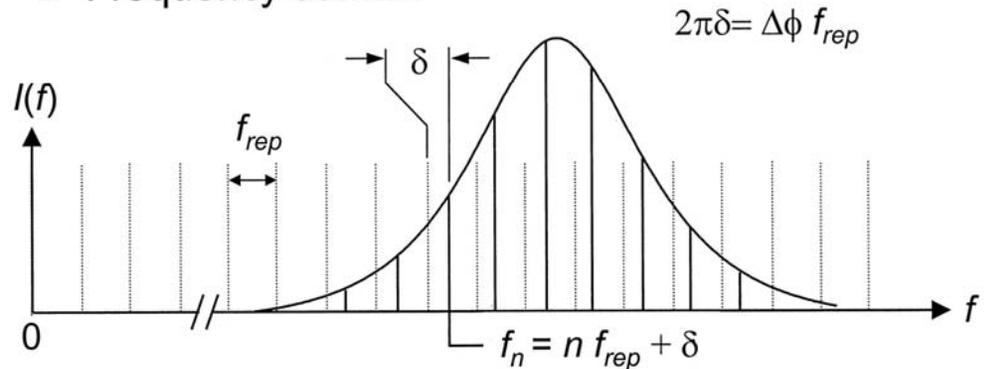

A Time domain

$$2\pi\delta = \omega_0 = \frac{\partial}{\partial t} [(\Delta\phi / \tau)t]$$

$$= (\Delta\phi) / \tau$$

B Frequency domain

Feedback Control can yield $\Delta\phi < 10^{-3}$ rad.

Characteristics of Frequency Comb

- Well defined optical field: $E(t)=A(t)\cos\omega t$
- Femtosecond periodic pulses: $A(t)=A(t+T)$
- Thousands of equally spaced spectral lines with KHz linewidth
