Case

Summary

- An alternative theory of gravity, which is equivalent to General Relativity.
- This is a curvatureless gravity theory, and the gravitational effect comes from torsion instead of curvature.

Case

Summary

- The dynamical variable of teleparallel gravity is the vierbein fields  $e_A(x^\mu)$ , which form an orthonormal basis for the tangent space at each point  $x^\mu$  of the manifold:  $e_A \cdot e_B = \eta_{AB}$ , where  $\eta_{AB} = \text{diag}(1, -1, -1, -1)$ .
- Notation:  
Greek indices  $\mu, \nu, \dots$  : coordinate space-time.  
Latin indices  $A, B, \dots$  : tangent space-time.
- The relationship between metric and vierbein fields is

$$g_{\mu\nu}(x) = \eta_{AB} e_\mu^A(x) e_\nu^B(x).$$

Case

Summary

- Weitzenböck connection: a curvatureless connection

$$\overset{\mathbf{w}}{\Gamma}_{\nu\mu}^{\lambda} \equiv e_A^{\lambda} \partial_{\mu} e_{\nu}^A$$

- The torsion tensor is defined as

$$T_{\mu\nu}^{\lambda} \equiv \overset{\mathbf{w}}{\Gamma}_{\nu\mu}^{\lambda} - \overset{\mathbf{w}}{\Gamma}_{\mu\nu}^{\lambda} = e_A^{\lambda} (\partial_{\mu} e_{\nu}^A - \partial_{\nu} e_{\mu}^A).$$

- Under Weitzenböck connection, the Riemann tensor vanishes:

$$R_{\mu\sigma\nu}^{\rho} = \overset{\mathbf{w}}{\Gamma}_{\mu\nu,\sigma}^{\rho} - \overset{\mathbf{w}}{\Gamma}_{\mu\sigma,\nu}^{\rho} + \overset{\mathbf{w}}{\Gamma}_{\delta\sigma}^{\rho} \overset{\mathbf{w}}{\Gamma}_{\mu\nu}^{\delta} - \overset{\mathbf{w}}{\Gamma}_{\delta\nu}^{\rho} \overset{\mathbf{w}}{\Gamma}_{\mu\sigma}^{\delta} = 0.$$

Teleparallel  
Dark Energy

Observational  
Constraints

$V(\phi) = 0$   
Case

Summary

- We can construct the “teleparallel Lagrangian” by using the torsion tensor,  
$$\mathcal{L}_T = T = a_1 T^{\rho\mu\nu} T_{\rho\mu\nu} + a_2 T^{\rho\mu\nu} T_{\nu\mu\rho} + a_3 T_{\rho\mu}{}^{\rho} T_{\nu}{}^{\mu\nu}.$$
- It is a good approach of General Relativity when we choose the suitable parameters  $a_1 = \frac{1}{4}$ ,  $a_2 = \frac{1}{2}$  and  $a_3 = -1$ :

$$\tilde{R} = -T - 2\nabla^{\mu} T_{\mu\nu}^{\nu},$$

where  $\tilde{R}$  is constructed by Levi-Civita connection.

# Teleparallel Gravity

## A brief introduction

- The action of teleparallel gravity is

$$S = \int d^4x e \left[ \frac{T}{2\kappa^2} + \mathcal{L}_M \right],$$

where  $e = \det(e^A{}_\mu) = \sqrt{-g}$ .

- Varying this action respect to the vierbein fields gives the field equation

$$e^{-1} \partial_\mu (e e_A^\rho S_\rho^{\mu\nu}) - e_A^\lambda T^\rho{}_{\mu\lambda} S_\rho{}^{\nu\mu} - \frac{1}{4} e_A^\nu T = \frac{\kappa^2}{2} e_A^\rho \overset{\text{em}}{T}{}_\rho{}^\nu,$$

where  $\overset{\text{em}}{T}{}_\rho{}^\nu$  stands for the energy-momentum tensor and  $S_\rho{}^{\mu\nu} = \frac{1}{4} (T^\nu{}_\rho{}^\mu - T^{\mu\nu}{}_\rho + T_\rho{}^{\mu\nu}) + \frac{1}{2} (\delta_\rho^\mu T^\alpha{}_\nu{}^\alpha - \delta_\rho^\nu T^\alpha{}_\mu{}^\alpha)$ .

Case

Summary

- Teleparallel dark energy model is a dark energy model, which can explain the late time accelerating universe.
- This model combines quintessence model with teleparallel gravity.
- This model differs from quintessence model when we turn on the non-minimal coupling term.

# Teleparallel Dark Energy

Teleparallel  
Gravity

Teleparallel  
Dark Energy

Observational  
Constraints

$V(\phi) = 0$   
Case

Summary

- Quintessence is one of the most popular dark energy model.
- The generalized quintessence model action is given by

$$S = \int d^4x \sqrt{-g} \left[ \frac{R}{2\kappa^2} + \frac{1}{2} (\partial_\mu \phi \partial^\mu \phi + \xi R \phi^2) - V(\phi) + \mathcal{L}_M \right]$$

# Teleparallel Dark Energy

## A brief review of quintessence model

- Under the flat Friedmann-Robertson-Walker (FRW) background  $ds^2 = dt^2 - a^2(t)d\vec{x}^2$ , the gravitational field equations can be derived as

$$H^2 \equiv \left(\frac{\dot{a}}{a}\right)^2 = \frac{\kappa^2}{3} (\rho_\phi + \rho_m + \rho_r),$$

$$\dot{H} = -\frac{\kappa^2}{2} (\rho_\phi + p_\phi + \rho_m + 4\rho_r/3),$$

where  $\rho_\phi$  and  $p_\phi$  are the effective energy and pressure density

$$\rho_\phi = \frac{1}{2}\dot{\phi}^2 + V(\phi) + 6\xi H\phi\dot{\phi} + 3\xi H^2\phi^2,$$

$$p_\phi = \frac{1}{2}\dot{\phi}^2 - V(\phi) + \xi \left(2\dot{H} + 3H^2\right) \phi^2 + 4\xi H\phi\dot{\phi} + 2\xi\phi\ddot{\phi} + 2\xi\dot{\phi}^2$$

Gravity

Chung-Chi  
Lee

Teleparallel  
Gravity

Teleparallel  
Dark Energy

Observational  
Constraints

$V(\phi) = 0$   
Case

Summary

- Similar to quintessence model, we can construct teleparallel dark energy model, and the action is given by

$$S = \int d^4x e \left[ \frac{T}{2\kappa^2} + \frac{1}{2} (\partial_\mu \phi \partial^\mu \phi + \xi T \phi^2) - V(\phi) + \mathcal{L}_M \right].$$

- Variation of action with respect to the vierbein fields yields the field equation

$$\begin{aligned} \left( \frac{2}{\kappa^2} + 2\xi \phi^2 \right) & \left[ e^{-1} \partial_\mu (e e_A^\rho S_\rho^{\mu\nu}) - e_A^\lambda T^\rho_{\mu\lambda} S_\rho^{\nu\mu} - \frac{1}{4} e_A^\nu T \right] \\ & - e_A^\nu \left[ \frac{1}{2} \partial_\mu \phi \partial^\mu \phi - V(\phi) \right] + e_A^\mu \partial^\nu \phi \partial_\mu \phi \\ & + 4\xi e_A^\rho S_\rho^{\mu\nu} \phi (\partial_\mu \phi) = e_A^\rho T^{\text{em}}{}_\rho{}^\nu. \end{aligned}$$

Gravity

Chung-Chi  
Lee

Teleparallel  
Gravity

Teleparallel  
Dark Energy

Observational  
Constraints

$V(\phi) = 0$   
Case

Summary

- Again, the effective energy and pressure density under FRW metric ( $e^A_\mu = \text{diag}(1, a, a, a)$ ) are

$$\rho_\phi = \frac{1}{2}\dot{\phi}^2 + V(\phi) - 3\xi H^2 \phi^2,$$

$$p_\phi = \frac{1}{2}\dot{\phi}^2 - V(\phi) + 4\xi H \phi \dot{\phi} + \xi (3H^2 + 2\dot{H}) \phi^2.$$

- Variation of action with respect to the scalar field gives us the equation of motion of the scalar field

$$\ddot{\phi} + 3H\dot{\phi} + 6\xi H^2 \phi + V'(\phi) = 0.$$

- These equations lead to the continuity equation  $\dot{\rho}_\phi + 3H(1 + w_\phi)\rho_\phi = 0$ , where  $w_\phi$  is the equation of state of the scalar field, which is defined as  $w_\phi \equiv \frac{p_\phi}{\rho_\phi}$ .

Lee

Teleparallel  
Gravity

Teleparallel  
Dark Energy

Observational  
Constraints

$V(\phi) = 0$   
Case

Summary

- In the minimal coupling case ( $\xi = 0$ ), the teleparallel dark energy is equivalent to quintessence model
- However, these two models are different theories when we turn on the non-minimal coupling constant ( $\xi \neq 0$ )
- Teleparallel dark energy model can cross the phantom-divide easily.

Dark Energy

Observational  
Constraints

$V(\phi) = 0$   
Case

Summary

- We would like to test teleparallel dark energy model by using the SNIa, BAO and CMB data. These observational data can tell us whether this is a suitable model for dark energy or not
- We consider three kinds of potential cases:  
Power-Law potential:  $V(\phi) = V_0\phi^4$   
Exponential potential:  $V(\phi) = V_0e^{-\kappa\phi}$   
Inverse hyperbolic cosine potential:  $V(\phi) = \frac{V_0}{\cosh(\kappa\phi)}$

# Teleparallel Dark Energy: Observational Constraints

- Potential:  $V(\phi) = V_0\phi^4$
- Left: fixing  $\Omega_m = 27\%$ , the best fit locates at  $h \simeq 0.7$ ,  $\xi \simeq -0.42$ ,  $w_\phi \simeq -0.96$  and  $\chi^2 \simeq 543.9$
- Right: fixing  $\xi = -0.41$ , the best fit locates at  $h \simeq 0.7$ ,  $\Omega_m \simeq 28.0\%$ ,  $w_\phi \simeq -0.99$  and  $\chi^2 \simeq 544.5$

# Teleparallel Dark Energy: Observational Constraints

- Potential:  $V(\phi) = V_0 e^{-\kappa\phi}$
- Left: fixing  $\Omega_m = 27\%$ , the best fit locates at  $h \simeq 0.7$ ,  $\xi \simeq -0.41$ ,  $w_\phi \simeq -1.04$  and  $\chi^2 \simeq 544.3$
- Right: fixing  $\xi = -0.41$ , the best fit locates at  $h \simeq 0.7$ ,  $\Omega_m \simeq 27.1\%$ ,  $w_\phi \simeq -1.07$  and  $\chi^2 \simeq 544.6$

# Teleparallel Dark Energy: Observational Constraints

- Potential:  $V(\phi) = \frac{V_0}{\cosh(\kappa\phi)}$
- Left: fixing  $\Omega_m = 27\%$ , the best fit locates at  $h \simeq 0.7$ ,  $\xi \simeq -0.38$ ,  $w_\phi \simeq -1.05$  and  $\chi^2 \simeq 544.8$
- Right: fixing  $\xi = -0.41$ , the best fit locates at  $h \simeq 0.7$ ,  $\Omega_m \simeq 26.7\%$ ,  $w_\phi \simeq -1.03$  and  $\chi^2 \simeq 545.1$

Dark Energy  
with Purely  
Non-minimal  
Coupling to  
Gravity

Chung-Chi  
Lee

Teleparallel  
Gravity

Teleparallel  
Dark Energy

Observational  
Constraints

$V(\phi) = 0$   
Case

Summary

- Here, we consider the simplest model  $V(\phi) = 0$ .
- The gravity action is rewritten as

$$S = \int d^4x e \left[ \frac{T}{2\kappa^2} + \frac{1}{2} (\partial_\mu \phi \partial^\mu \phi + \xi T \phi^2) + \mathcal{L}_M \right].$$

# $V(\phi) = 0$ Case

## Modified Friedmann Equation

- Under FRW metric ( $e_{\mu}^A = \text{diag}(1, a, a, a)$ ), the scalar field and the gravitational field equations read

$$\ddot{\phi} + 3H\dot{\phi} + 6\xi H^2\phi = 0,$$

$$H^2 \equiv \left(\frac{\dot{a}}{a}\right)^2 = \frac{\kappa^2}{3} (\rho_{\phi} + \rho_m + \rho_r),$$

$$\dot{H} = -\frac{\kappa^2}{2} (\rho_{\phi} + p_{\phi} + \rho_m + 4\rho_r/3),$$

where the matter energy density  $\rho_m \propto a^{-3}$ , the radiation energy density  $\rho_r \propto a^{-4}$

- The energy density and pressure

$$\rho_{\phi} = \frac{1}{2}\dot{\phi}^2 - 3\xi H^2\phi^2,$$

$$p_{\phi} = \frac{1}{2}\dot{\phi}^2 + 4\xi H\phi\dot{\phi} + \xi \left(3H^2 + 2\dot{H}\right)\phi^2.$$

# $V(\phi) = 0$ Case

## Exact Solution in RD and MD

Teleparallel  
Dark Energy  
with Purely  
Non-minimal  
Coupling to  
Gravity

Chung-Chi  
Lee

Teleparallel  
Gravity

Teleparallel  
Dark Energy

Observational  
Constraints

$V(\phi) = 0$   
Case

Summary

- When the universe is undergoing a radiation-dominated (RD) and matter-dominated (MD) eras, the Hubble parameter has the form:  $H = \frac{A}{t}$ , where  $A = \frac{2}{3(1+w_{eff})}$  and  $w_{eff}$  is the total EoS.
- Substituting that into the scalar field equation, one can obtain the exact solution:

$$\begin{aligned}\phi(t) &= C_1 t^{l_1} + C_2 t^{l_2}, \\ l_{1,2} &= \frac{1}{2} \left[ \pm \sqrt{(3A - 1)^2 - 24\xi A^2} - (3A - 1) \right],\end{aligned}$$

where  $C_{1,2}$  are constants.

- There exist an increasing mode and a decreasing mode.

# $V(\phi) = 0$ Case

## Exact Solution in RD and MD

- Consequently, one obtains

$$\text{RD: } w_\phi = \frac{1}{3} \left( 2 - \sqrt{1 - 24\xi} \right), \quad \rho_\phi \propto a^{-5 + \sqrt{1 - 24\xi}};$$

$$\text{MD: } w_\phi = \frac{1}{2} \left( 1 - \sqrt{1 - 32\xi/3} \right), \quad \rho_\phi \propto a^{(-9 + \sqrt{9 - 96\xi})/2}.$$

**Table:** Explicit solutions of the scalar field in RD and MD with different values of  $\xi$ .

$\xi$	(i) $0^-$		(ii) $-1/8$		(iii) $-3/4$		(iv) $-1$	
Era	RD	MD	RD	MD	RD	MD	RD	MD
$l_1$	$-3\xi$	$\frac{-8\xi}{3}$	$\frac{1}{4}$	$+0.26$	$0.84$	$+1$	$+1$	$+1.21$
$w_\phi$	$\frac{1}{3} + 4\xi$	$\frac{-8\xi}{3}$	$0$	$-0.26$	$-0.79$	$-1$	$-1$	$-1.21$
$\rho_\phi \propto$	$a^{-4 - 12\xi}$	$a^{-3 - 8\xi}$	$a^{-3}$	$a^{-2.21}$	$a^{-0.64}$	Const.	Const.	$a^{0.62}$

# $V(\phi) = 0$ Case

## Exact Solution in SD

- When the universe is dominated by dark energy, the scalar-dominated era, we deduce the evolution of the scalar field from the second modified Friedmann equation (gravitational field equation),

$$\frac{1}{F(\phi)} \left( \frac{d\phi}{d \ln a} \right)^2 = \frac{6}{\kappa^2} \Rightarrow \phi(a) = \pm \frac{\sin \theta}{\sqrt{-\kappa^2 \xi}},$$

where  $F(\phi) \equiv 1 + \kappa^2 \xi \phi^2$  and  $\theta(a) = \sqrt{-6\xi} \ln a + C_3$ .

- The equation of state can also be derived as

$$w_\phi = -1 - \sqrt{-32\xi/3} \tan \theta.$$

# $V(\phi) = 0$ Case

## Numerical Demonstration

- The EoS has the fix points at RD and MD eras.
- The EoS is monotonically decreasing and reaches the singularity  $w_\phi \rightarrow \infty$ .
- The different initial condition corresponds to the same final state of  $(\Omega_m, w_\phi)$  figure in current stage.

Lee

Teleparallel  
Gravity

Teleparallel  
Dark Energy

Observational  
Constraints

$V(\phi) = 0$   
Case

Summary

- There are four classes of finite-time singularity <sup>1</sup>
  - Type I (Big Rip): For  $t \rightarrow t_s$ ,  $a \rightarrow \infty$ ,  $\rho \rightarrow \infty$  and  $|p| \rightarrow \infty$ .
  - Type II (sudden): For  $t \rightarrow t_s$ ,  $a \rightarrow a_s$ ,  $\rho \rightarrow \rho_s$  and  $|p| \rightarrow \infty$ .
  - Type III: For  $t \rightarrow t_s$ ,  $a \rightarrow a_s$ ,  $\rho \rightarrow \infty$  and  $|p| \rightarrow \infty$ .
  - Type IV: For  $t \rightarrow t_s$ ,  $a \rightarrow a_s$ ,  $\rho \rightarrow 0$ ,  $|p| \rightarrow 0$  and higher derivatives of  $H$  diverge.

---

# $V(\phi) = 0$ Case

## “Type III” Singularity

- For the universe dominated by matter and dark energy, we deduce an integrable equation from the gravitational field equation:

$$\begin{aligned}\frac{d}{dt} [F(\phi)a^3H] &= \frac{\kappa^2}{2}\rho_m a^3 = \frac{3}{2}H_0^2\Omega_m^{(0)}, \\ F(\phi) &\equiv 1 + \kappa^2\xi\phi^2,\end{aligned}$$

- Through the equation

$$Fa^3H = C_4 \rightarrow H = \frac{C_4}{a^3F} = \frac{C_4}{a^3\cos^2\theta(a)},$$

we can estimate that  $H$  is always positive and goes to infinite at  $\theta = \pi/2$  in  $\phi$ -dominated era.

**Figure:** The  $1\sigma$ – $3\sigma$  confidence regions in  $(\Omega_{m0}, \xi)$  (left panel) and  $(\Omega_{m0}, w_{\phi_0})$  (right panel) obtained from the SNIa (blue), BAO (green), CMB (red), and the combined (black) data.

# Summary

- Teleparallel gravity is an alternative gravity theory of the universe.
- Teleparallel dark energy model is equivalent to quintessence model happens at the minimal coupling case ( $\xi = 0$ ), but it has a different behavior when we include a non-minimal coupling term ( $\xi \neq 0$ ).
- We show that the equation of state of teleparallel dark energy model can cross the phantom-divide easily.
- The observational constraints show a good result on this model. This model is suitable for the late-time accelerating universe.
- We deduce the exact solution of teleparallel dark energy without potential, and demonstrate this behavior by numerical result.
