Major Research Subjects

- Enhancement of κ in the new phase through epitaxy
- Fundamental study by IETS for detections of phonons and defects in high κ dielectrics
- Room temperature ferromagnetism in cluster free, Co doped HfO_2 films

Can you make κ even higher ?

“Phase Transition Engineering”

---Enhancement of κ in the New Phase
through Epitaxy

Crystal structures of HfO_2 and the corresponding κ

Dielectric constants 29 70 16 *

Stable phase temperature $>2700^\circ\text{C}$ $>1750^\circ\text{C}$ $<1750^\circ\text{C}$

The dielectric constant increases when HfO_2 structure is changed from monoclinic to other symmetry

* Xinyuan Zhao and David Vanderbrit, P.R.B. 65, 233106, (2002).

Permittivity Increase of Yttrium-doped HfO_2 Through Structural Phase Transformation

by Koji Kita, Kentaro Kyuno, and Akira Toriumi, Tokyo Univ.

- ❖ Yttrium serves effectively as a dopant to induce a phase transformation from the **monoclinic** to the **cubic** phase even at 600°C .
- ❖ Yttrium-doped HfO_2 films show higher permittivity than undoped HfO_2 , and the permittivity as high as 27 is obtained by 4 at. % yttrium doping.
- ❖ The permittivity of undoped HfO_2 is reduced significantly at high temperature, whereas that of 17 at. % yttrium-doped film shows no change even at 1000°C .

MBE-HfO₂(0.8)/Y₂O₃(0.2)

Increase of κ from 15 to over 30 in cubic phase !

Cross Sectional HRTEM Study of The Y-doped HfO_2 Films in Cubic Phase

Interfaces of YDH(100)/GaAs, and YDH(111)/Si are atomically sharp

HRTEM image of yttrium-doped HfO_2 films 11 nm thick on GaAs (001).

HRTEM image of yttrium-doped HfO_2 films 7.5 nm thick on Si (111).

The Enhancement of κ through “Phase Transition Engineering”

$$\kappa = (1 + 8\pi \alpha_m / 3V_m) / (1 - 4\pi \alpha_m / 3V_m)$$

Clausius-Mossotti Relation

Change of molar volume in Y doped HfO₂

- Many high κ materials, such as HfO₂, ZrO₂, TiO₂, Ta₂O₅, commonly have high temperature phases with a higher κ .
- Achieve the enhancement through **phase transition engineering** by additions of dopants such as lower valence cations, followed by proper post high temperature anneals.

*IETS Study to Detect
Phonons and Defects in High κ Dielectrics*

But what is inside of high κ ?

Electrical characterization / optimization

-- Good News !!

- Low electrical leakage is common .
- Have Attained an EOT under 1.0-1.4 nm .

-- Major problems are :

- High interfacial state density
- Large trapped charge
- Low channel mobility
- Electrical stability and reliability

Degradation of Mobility in High κ Gate Stack

Temperature dependence of mobility

Phonons may have reduced mobility seriously !

Fechetti et al, JAP **90**, 4587, (2001).

Correction from the charge trapping effect

- Effective mobility for HfO_2 is lower than universal mobility even after interface correction.

Possible Source of Mobility Degradation

Interactions Detectable by IETS

- ❑ Substrate Silicon Phonons
- ❑ Gate Electrode Phonons
- ❑ Dielectric Phonons
- ❑ Chemical Bonding
- ❑ Interfacial Structures
- ❑ Defects (Trap States)

Trap-Related Signatures in IETS

Wei He and T.P.Ma, APL **83**,2605, (2003) ; APL **83**, 5461, (2003).

Inelastic Electron Tunneling Spectroscopy (IETS)

Charge trapping will cause shift in the threshold voltage.

Trap-assisted conduction will cause increased leakage current.

	3	99	108	51.7	0.48

Can you make HfO_2 magnetic ?

Diluted Magnetic Oxides

“Observation of Room Temperature Ferromagnetic Behavior in Cluster Free, Co doped HfO_2 Films”

Appl. Phys. Lett. 91, 082504 (2007)

Introduction and motivation

- Both injection and transport of spin-polarized carriers are necessary for the spintronic devices. Using **diluted magnetic semiconductor (DMS)** as the ferromagnetic contact is one way to achieve this goal.
- Several models such as **Zener's model**, **bound magnetic polaron**, and **F-center theory** were used to describe the ferromagnetism.
- The potential usage of **HfO₂** as alternative high- κ gate dielectrics in replacing SiO₂ for nano CMOS.
- Giant magnetic moment** in Co doped HfO₂ as reported recently.

HR-TEM Images of High-T and Low-T Grown Films

High-T (700°C) grown film
Monoclinic phase

Low-T (100°C) grown,
Polycrystalline film

EXAFS and Magnetic Characterization of High-T (700°C) Grown Films

□ EXAFS of the high-T grown samples showed a **progressive formation of Co clusters** in the film (Co = 1-20 at.%).

□ **Superparamagnetic** temperature dependence.

□ Saturation moment **increases** with increasing Co doping concentration.

1st O shell + 2nd Co shell
2.04 Å 2.49 Å

Magnetic Property of Low-T Grown Films

Substrate	40~100	40~100	40~100
Temperature ($^\circ\text{C}$)			
Doping concentration (at.%)	4.7	5.5	10
M_s at 10K (μ_B/Co)	0.47	0.36	0.13
M_s at 300K (μ_B/Co)	0.43	0.29	0.1

□ Ferromagnetic behavior was observed at both 10K and 300K.

□ The magnetic moment decreases with increasing Co doping due to enhanced dopant dopant associations.

□ The magnetic properties are stable after annealing in O_2 at 350°C .

□ Correlation between saturation magnetization with concentrations of oxygen vacancies

F-center Exchange Mechanism:

--An electron orbital created by an **oxygen vacancy** with trapped electrons is expected to correlate with magnetic spins dispersed inside the oxides.

Impurity-band Exchange Model :

--The hydrogenic orbital formed by **donor defect (like oxygen vacancy)** associated with an electron overlaps to create delocalized impurity bands.

-- If the donor concentration is large enough and interacts with the magnetic cations with their 3d orbitals to form **bound magnetic polarons** leading to ferromagnetism.

$$\gamma^3 \delta_p \approx 4.3, \text{ where } \gamma = \varepsilon(m/m^*)$$

δ_p : polaron percolation threshold

x_p : cation percolation threshold

γ_H : hydrogenic radius

M. Coey et al,
Nature Materials, 2005.

Theoretical Analysis Using Impurity Band Exchange Model

Material	ϵ	m^*/m	γ	γ_H (nm)	δ_p (10^{-6})
ZnO	4	0.28	14	0.76	1500
TiO ₂	9	1	9	0.48	5900
SnO ₂	3.9	0.24	16	0.86	1000
HfO ₂	15	0.1	150	7.95	1.27
Al ₂ O ₃	9	0.23	39	2.07	72

δ_p : Polaron percolation threshold

x_p : Cation percolation threshold

γ_H : Hydrogenic orbital radius

- δ_p and x_p are two landmarks on magnetic phase diagram.
- Ferromagnetism occurs when $\delta > \delta_p$ and $x < x_p$.
- δ_p of HfO₂ based DMO is about 1.27×10^{-6} - 8.15×10^{-5}
- Appearance of ferromagnetic insulator behavior in HfO₂ is more likely than ZnO, TiO₂ and SnO₂.
- Will try Y₂O₃, ZrO₂, and Al₂O₃ etc.

Major Research Topics

- Novel MBE template approach for ALD growth
- Enhancement of κ in the new phase through epitaxy
- Fundamental study by IETS for detections of phonons and defects in high κ dielectrics
- Room temperature ferromagnetism in cluster free, Co doped HfO_2 films
