

Introduction to Nanophysics

Prof. J. Raynien Kwo

**Department of Physics
National Tsing Hua University**

2/2015

What is the size for a “nano” ?

One (nm) equals to 1/1000000000 (10⁻⁹) meter

10⁻³ m , **Macro**

10⁻⁶ m , **Micro**

10⁻⁹ m , **Meso**

R. Feynmann Already Knew about this !

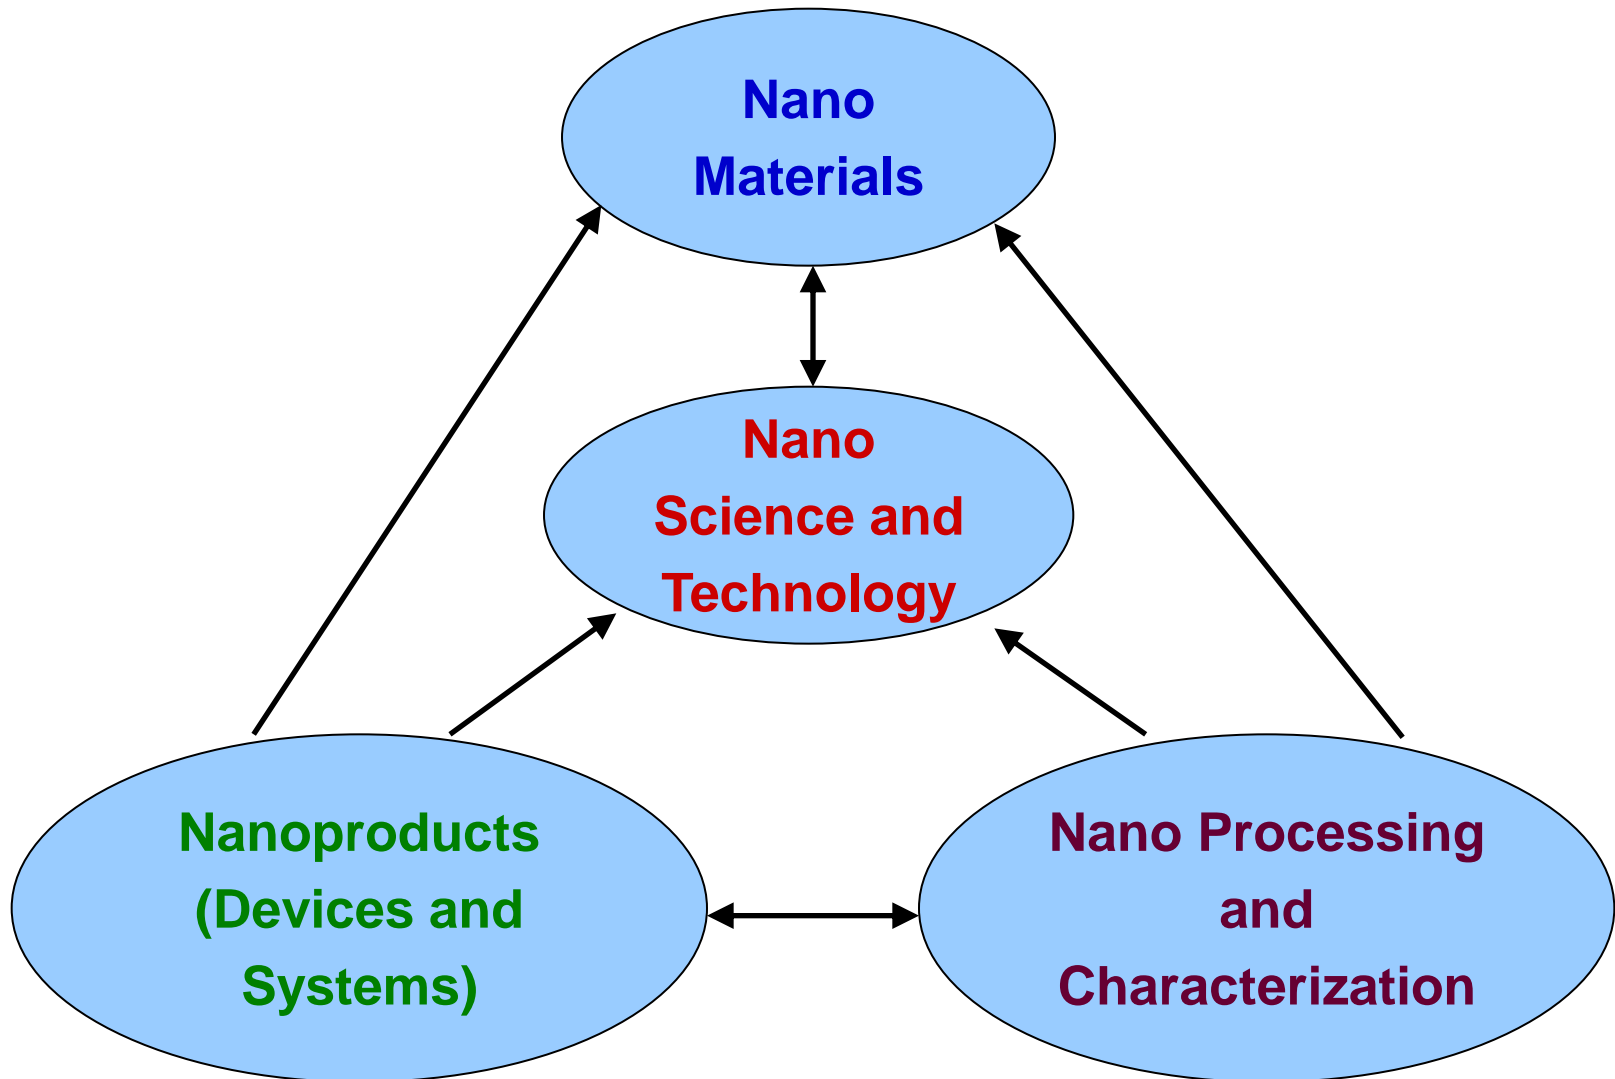

**“ There’s plenty of
room at the bottom ! ”
in 1959.**

Physicists noticed the “Nano” as early as

- 4th Century, Roman glassmaker: the color of glasses can be changed by mixing in metal particles
- In 1883, Films containing silver halides for photography were invented by George Eastman, founder of Kodak.
- 1908, Gustav Mie first provided the explanation of the size dependence of color.
- Vision from Feynman in 1959: “There is plenty room at the bottom”, and also recognized there are plenty of nature-given nanostructures in biological systems.
- 1950-1960, small metal particles were investigated by physicists.
- 1957, Ralph Landauer realized the importance of quantum mechanics plays in devices with small scales.
- Before 1997 => **mesoscopic** (or low dimensional) physics : quantum dots, wells, wires.....are known already.

Major Topics of Nanoscience and Technology

What is the Nano Technology?

➤ Science and Technology Down scaling to size under 100 nm:

Via “Top-down” lithographic patterning:

-- Moore’s law !

➤ Manipulate the atomic and molecular structures:

“Bottom-up” nano materials, growth and assembly.

Feymann: There’s plenty of room at the bottom

Major Driving Force pushing for Nano Technology: Due to the bottle neck in Microelectronics

Moore's Law :

A 30% decrease in the size of printed dimensions in every two years.

BASIC CHIPMAKING PROCESS

Bottom-up Nano systems & Self-Assembly

enabling of designing large molecules and nano materials

***Two basic modern electronic technologies
in Condensed Matter Physics Field***

Metal-Oxide-Field Effect Transistor

1960 Kahng and Atalla, First MOSFET

1970 First IC, 1 kbit, 750 khz microprocessor

電子科技之基礎--MOSFET

(metal-oxide-semiconductor field-effect transistor)

電子科技之基礎--磁記錄

*Five major lessons
that we have learned*

The First Lesson :

Bulk-to-nano Transition

Ex: size-dependence of melting temperature

Ph. Buffat and J-P. Borel, Phys. Rev. A13, 2287 (1976)

Ex: size-dependence of color

powered cadmium selenide

larger

smaller

Ex: size-dependence of magnetism

A. J. Cox et al. Phys. Rev. B49, 12295 (1994)

The Second Lesson :

The Advent of Nano Era

- **The ability of growing the nano scale materials and structures**
- **The ability of detecting and manipulating on the nano scale.**

(I) Advance in thin film growth:

Such as Molecular Beam Epitaxy, atomic layer deposition, laser MBE, etc...

➤ For nano electronics in metals, oxides, and semiconductors

(II) Detection at nano scale : STM, AFM, MFM, STEM, Cs-TEM

➤ In 1982, Binnig, and Rohrer in IBM invented scanning tunneling microscope (STM).

➤ In 1986, Binnig, Quate, and Gerber invented the atomic force microscope (AFM).

Integrated MBE Multi-chamber System

Now located in the Nano
Technology Center, ITRI,
Hsin Chu, Taiwan

**For Metal, Oxide and
Semiconductor Films
On the Nano scale**

Scanning Tunneling Microscope (STM)

Figure 1.10 Scanning tunneling microscope. (From C. Julian Chen, *Introduction to Scanning Tunneling Microscopy*, Oxford: Oxford University Press, 1993.)

Scanning Tunneling Microscope (STM) – Physicist used to detect nano structures

Nature 409, 304 (2001)

Quantum Corral

of 7.13 nm radius, 48 Fe atoms on the Cu (111) surface

Fe

This STM image shows the direct observation of standing-wave patterns in the local density of states of the Cu(111) surface. These spatial oscillations are quantum mechanical interference patterns caused by scattering of the 2D electron gas off the Fe adatoms and point defects.

InGaAs/InAlAs superlattices on InP Substrate

- Determining the interface location and sharpness is easy.
- The In-distribution seems to be inhomogeneous in the InAlAs layer (blue arrows).
- Note that InP substrate is In-terminated (red arrow).

Atomic Resolution STEM Imaging: Z-contrast

2-Å Electron Probe

SrTiO_3

Z-contrast

cubic; $a = 3.905 \text{ \AA}$

Electronic Exc.: Electron Energy-Loss Spectroscopy (EELS)

$$\Delta E = E_i - E_f$$

$$q = k_i - k_f$$

Coulomb Interaction

$$v(r) = \sum_j \frac{e^2}{|r - r_j|}$$

$$= \sum_q v_q \rho_q e^{iqr}$$

, where ρ_q the electron density operator

Inelastic Scattering (ΔE) Probability

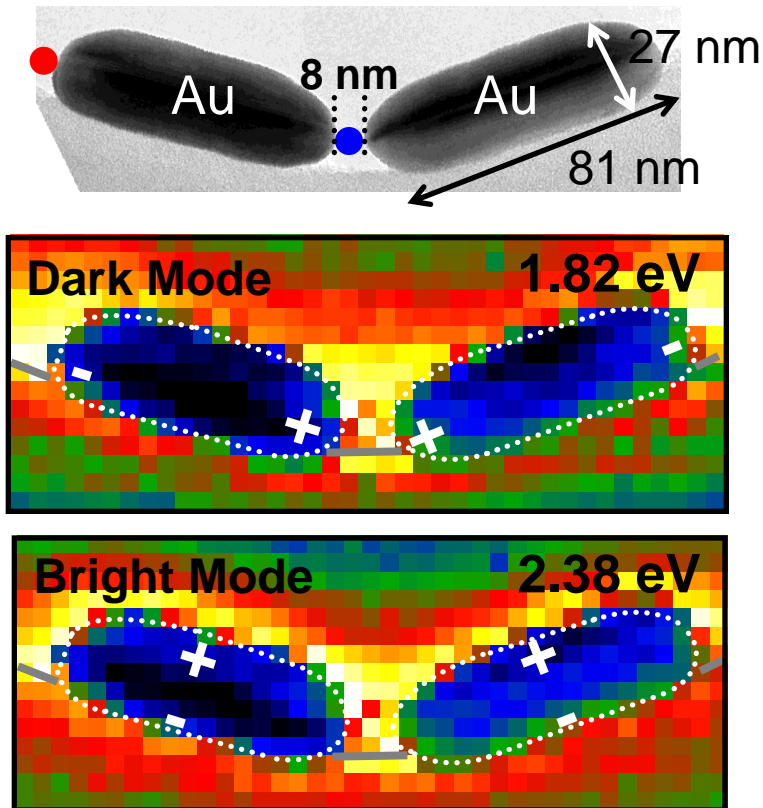

$$\frac{d^2\sigma}{d\Omega dE} \sim \sum_f \left| \langle \psi_f | v(q) | \psi_i \rangle \right|^2 \delta(E_i - E_f - \Delta E)$$

$$\sim \frac{1}{q^4} \cdot S(\omega, q) \longrightarrow \text{X-ray}$$

$$\sim \frac{1}{q^2} \cdot \text{Im} \left[\frac{1}{\varepsilon(\omega, q)} \right] \longrightarrow \text{EELS}$$

Spectral Imaging at Ultimate Spatial Resolution

Plasmonic Mapping: STEM-EELS (2-Å Probe)

M.-W. Chu *et al.*, Nano Lett. **9**, 399 (2009).

Chemical Mapping: STEM-EDX (1-Å Probe)

M.-W. Chu *et al.*, Phys. Rev. Lett. **104**, 196101 (2010).

The Third Lesson:

**The importance of
Quantum Physics**

The cause for variation of scaling

- Influence of Boundary
 - Increase of proportion of boundaries
 - Existence of surface / edge modes
 - Geometrical reconstruction
- Decrease of the number of particles
decrease of confinement , increase of perturbation
- Different scaling for different physical entity

Quantum Effect:

=> Most likely to have new breakthrough !

The connection of materials wave with mechanics

h = Planck constant
(6.626×10^{-34} joule-sec)

DeBroglie:

$$\lambda = h/p$$

Einstein:

$$E = h\nu = p^2/2m$$

Wave length

Free electrons

$$\lambda_{th}(300K) = 6.2nm$$

Semiconductors

$$10nm \leq \lambda \leq 100nm$$

Atoms

$$(300K) \leq 0.2nm$$

Bulk Limit

Nano Limit

**Bulk
materials**

$$\lambda \ll L$$

Nano

$$\lambda \sim L$$

Major Quantum Effect at the nano scale

- Interference
- Quantization
- Tunneling
- Quantum Spin

(I) Interference

The wonder of electron in waves

Electron source

A diagram showing an electron source on the left with three orange arrows pointing right towards a vertical blue line representing a barrier.

Classical mechanics

The wave property of electrons

Double Slit Interference of Electrons

Electron source

~

$$L \sim 1m$$

$$\lambda \sim 700nm$$

$$\lambda \sim 0.17nm$$

$$d \sim 10^{-1}mm = 10^{-4}m$$

$$\Delta y = \frac{L}{d} \lambda$$

$$= 7mm$$

$$\Delta y = 1.7\mu m$$

(II) Quantization

Confinement of the materials wave

Standing Wave

Quantizations

The Quantization of Energy

$n = 3$

$$L = \frac{n}{2} \lambda$$

$n = 2$

$$p = \frac{h}{\lambda} = \frac{nh}{2L}$$

$n = 1$

$$\delta E \propto 1/L^2$$

$$E_n = \frac{p^2}{2m} = \frac{n^2 h^2}{8mL^2}$$

(III) Tunneling and Nano-electronics

Classical Picture

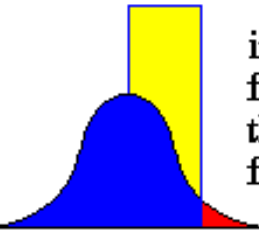

electron   electric field 

  in classical physics, the electron is repelled by an electric field as long as energy of electron is below energy level of the field

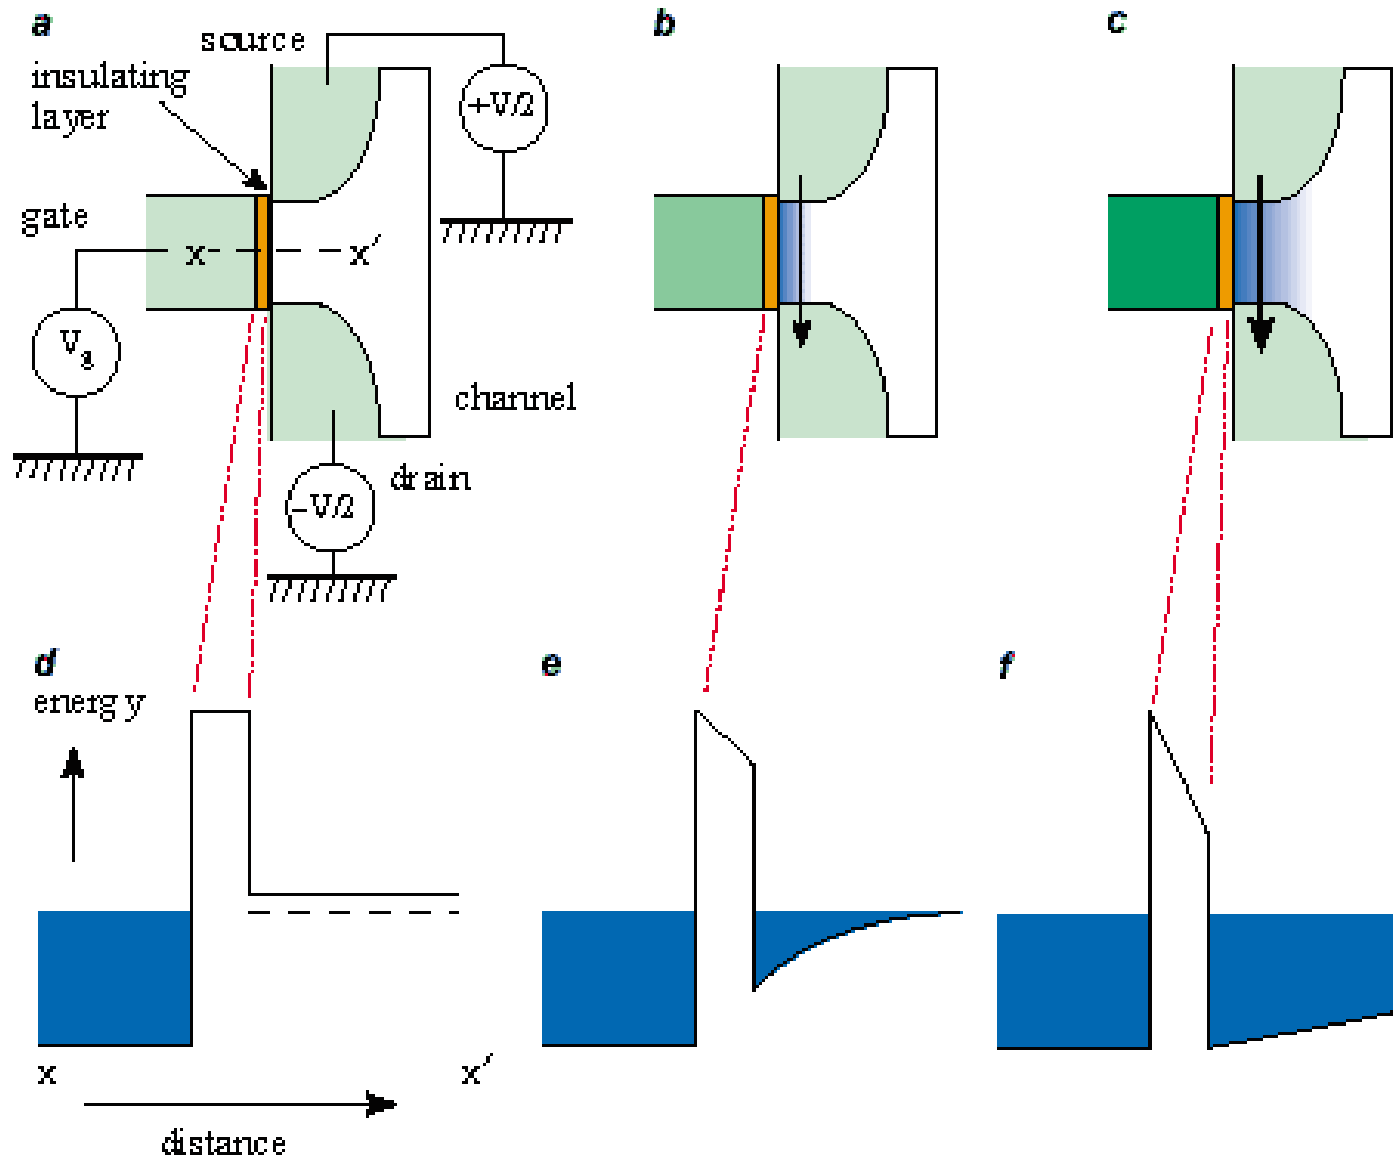

Quantum Picture

electron wave  

 ③nm

 in quantum physics, the wave function of the electron encounters the electric field, but has some finite probability of tunneling through

Quantum Tunneling is the major effect for the failure of Transistor at nano scale

近來大力推動奈米科技的背景

來自微電子學可能遭遇瓶頸的考慮

Moore's Law : 摩爾定律

A 30% decrease in the size of
printed dimensions every 1.5 years.

矽晶上電子原件數每1年半會增加一倍

Scaling Limits to CMOS Technology

Gate Oxide ~ 5 Si Atoms thick !

Shrinking the junction depth \Rightarrow increasing the carrier concentration

CMOS scaling, When do we stop ?

Reliability: 25 ~~22~~ ~~18~~ ~~16~~ Å

processing and yield issue

Tunneling : 15 Å

Design Issue: chosen for 1 A/cm² leakage

$I_{\text{on}}/I_{\text{off}} \gg 1$ at 12 Å

Bonding:

Fundamental Issues---

- how many atoms do we need to get bulk-like properties?
EELS -- Minimal 4 atomic layers !!
- Is the interface electronically abrupt?
- Can we control roughness?

In 1997, a gate oxide was 25 silicon atoms thick.

In 2007, a gate oxide will be 5 silicon atoms thick, if we still use SiO₂

and at least 2 of those 5 atoms will be at the interfaces.

Fundamental Materials Selection Guidelines

- Thermodynamic stability in contact with Si to 750°C and higher. **(Hubbard and Schlom)**
Alkaline earth oxide, IIIB, IVB oxide and rare earth oxide
- Dielectric constant, band gap, and conduction band offset
- Defect related leakage,
substantially less than SiO₂ at $t_{eq} < 1.5$ nm
- Low interfacial state density $D_{it} < 10^{11}$ eV⁻¹cm⁻²
- Low oxygen diffusivity
- Crystallization temperature >1000°C

t_{eq} : **equivalent oxide thickness (EOT) to be under 1.0 nm**

$$t_{eq} = t_{ox} \kappa_{\text{SiO}_2} / \kappa_{ox}$$

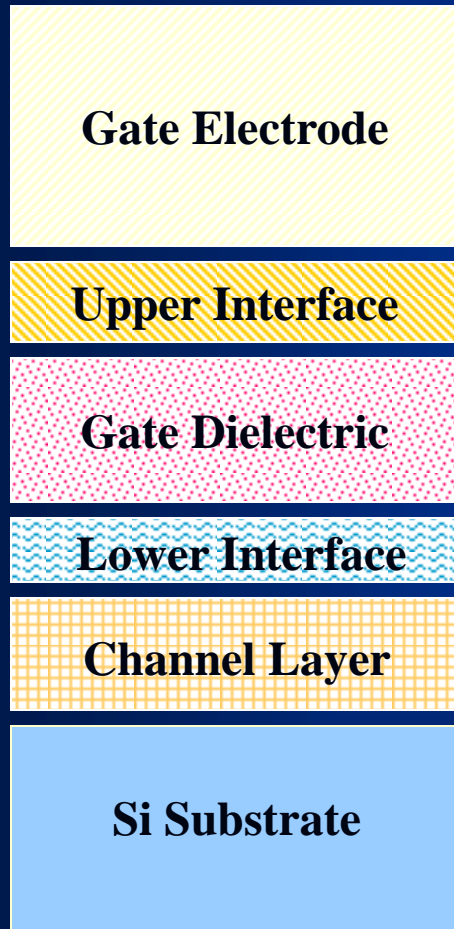

Basic Characteristics of Binary Oxide Dielectrics

Dielectrics	SiO ₂	Al ₂ O ₃	Y ₂ O ₃	HfO ₂	Ta ₂ O ₅	ZrO ₂	La ₂ O ₃	TiO ₂
Dielectric constant	3.9	9.0	18	20	25	27	30	80
Band gap (eV)	9.0	8.8	5.5	5.7	4.5	7.8	4.3	3.0
Band offset (eV)	3.2	2.5	2.3	1.5	1.0	1.4	2.3	1.2
Free energy of formation MO _x +Si ₂ → M+ SiO ₂ @727C, Kcal/mole of MO _x	-	63.4	116.8	47.6	-52.5	42.3	98.5	7.5
Stability of amorphous phase	High	High	High	Low	Low	Low	High	High
Silicide formation ?	-	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Hydroxide formation ?	-	Some	Yes	Some	Some	Some	Yes	Some
Oxygen diffusivity @950C (cm ² /sec)	2x 10 ⁻¹⁴	5x 10 ⁻²⁵	?	?	?	10 ⁻¹²	?	10 ⁻¹³

Integration Issues for High κ Gate Stack

FET Gate Stack

Critical Integration Issues

- Morphology dependence of leakage
Amorphous vs crystalline films?
- Interfacial structures
- Thermal stability
- Gate electrode compatibility
- Reliability

Fundamental Limitations

- Fixed charge
- Dopant depletion in poly-Si gate
- Dopant diffusion
- Increasing field in the channel region

Giant Magnetoresistance(GMR)

❖ What is GMR?

- ✦ GMR is a very large change in electrical resistance that is observed in a ferromagnet/paramagnet multilayer structure.
- ✦ Resistance change occurs when the relative orientations of the magnetic moments in alternate ferromagnetic layers change as a function of applied field.
- ✦ The total resistance of this material is lowest when the magnetic orientations of the ferromagnetic layers are aligned, is highest when the orientations are anti-aligned.

Para.
Ferro.

M. N. Baibich, J. M. Broto, A. Fert, F. Nguyen Van Dau, and F. Petroff,
Phys. Rev. Lett., **61**, 2472 (1988).

First Evidence of GMR

H_s corresponds to the field at which all layer magnetizations point along the field direction.

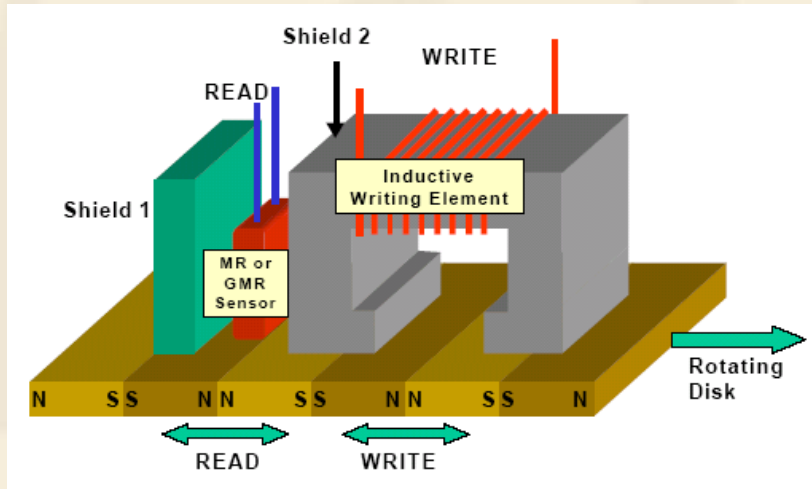

Spin-Valve GMR

- ✧ The simple structure of Spin-valve GMR is

- ✧ The magnetisation of the top permalloy layer is free to rotate as the field is varied. Second permalloy layer is fixed due to its exchange interaction with the iron–manganese layer.

GMR Spin Valve Reading Head

✧ Magnetization is stored as a “0” in one direction and as a “1” in the other. This is the magnetic field sensed by the GMR head.

✧ When the head passes over these magnetic bits, the magnetization direction of the free layer in the head responds to the field in each bit by rotating either up or down.

✧ The resulting change in the resistance is sensed by the voltage across the GMR head (current passing through the GMR element is constant).

Quantum behavior of ferromagnets

-Spin as a quantum qubit

$$qubit = \alpha |0\rangle + \beta |1\rangle$$

**Due to superposition
More information!**

Tentative roadmap

**Can we take the “charge” out of Spintronics ?
To generate pure spin current !**

Spintronics vs Electronics

- ✓ Reducing the heat generated in traditional electronics is a major driving force for developing spintronics.
- ✓ Spin-based transistors do not strictly rely on the raising or lowering of electrostatic barriers, hence it may overcome scaling limits in charge-based transistors.
- ✓ Spin transport in semiconductors may lead to dissipationless transfer of information by pure spin currents.
- ✓ Allow computer speed and power consumption to move beyond limitations of current technologies.

Reliable generation of pure spin currents !

- ✓ Spin Hall effect (2004)
- ✓ Spin Pumping (2006)
- ✓ Inverse Spin Hall effect (2006)
- ✓ Spin Seebeck effect (2008)
- ✓ Spin Caloritronics (2010)

- 4 fold increase in capacitance
- Optimal capacitance of 1380 F/g at 600 mV/s (theory: 1450 F/g)
- Output current as high as 23 mA/cm²
- Stable at high scan rate
- 10 fold increase in charge-discharge rate

A Man-made Moth Eye

Broadband and Quasi-omni-directional Anti-reflection Properties with Biomimetic Silicon Nanostructure

Y. F. Huang, et al., *Nature Nanotechnology* 2, 770-774 (2007) & US Patent 2005

Featured by NPG Asia Materials, March 2008

Many plants and animals have tiny surface structures that absorb certain wavelengths of light. These naturally formed nanostructures provide the colors in butterfly wings, camouflage for cicadas and enable moths to capture as much light as possible when flying at night. Now, we have created nanostructure surfaces which mimic moth eye and surpass its function in anti-reflection in that they absorb almost all incident light.

Building a Nano-scale Bridge On-chip

On-chip Fabrication of Well Aligned and Contact Barrier-Free GaN Nanobridge Devices with Ultrahigh Photocurrent Responsivity

R. S. Chen, et al., Small 4, 925-929 (2008)

- Nanowire: Naturally formed core-shell structure, 1D electron gas-like property
- On-chip process for building GaN nanobridge devices, which provide a large surface area, short transport path, and high responsivity for next-generation sensors and detectors

The Fifth Lesson:

Nano photonics

and

Bio-applications

Nano-photonics and Plasmonics

Near-field examination of blue-ray discs

Dr. Juen-Kai Wang, CCMS, NTU

S-SNOM setup

Near-field image of recorded disc

TEM image of recorded mark

- **Scattering-type SNOM reveals sub-10 nm optical signature.**
- The optical contrasts of the dark and the bright regions in near-field image of phase-change layer correspond to amorphous and polycrystalline AgInSbTe, respectively.
- Small bright spots with a size of ~30 nm emerge within the dark region, corresponding to the nano-sized ordered domains in the TEM image.
- **s-SNOM provides a direct optical probe in nanometer scale for high density optical storage media.**

Creating Monodispersed Ordered Arrays of Surface-Magic-Clusters and Anodic Alumina Nanochannels by Constrained Self-organization

SERS detection of bacterial cell wall

Dr. Juen-Kai Wang, CCMS, NTU

- Sensitive and stable SERS profiles based on our substrates readily reflect different bacterial cell walls found in Gram-positive, Gram-negative, and mycobacteria group.
- Characteristic changes in SERS profile are recognized in the drug-sensitive bacteria of antibiotic exposure, which could be used to differentiate them from the drug-resistant ones.

Papers to read

- “Observation of a Magnetic Antiphase Domain Structure with Long-Range Order in a Synthetic Gd-Y Superlattice”, C. F. Majkrzak, J. W. Cable, J. Kwo, M. Hong, D. B. McWhan, Y. Yafet, J. V. Waszczak, and C. Vettier, *Phys. Rev. Lett.* **56**, 2700, (1986).
- M. N. Baibich, J. M. Broto, A. Fert, F. Nguyen Van Dau, F. Petroff, *Phys. Rev. Lett.*, **61**, 2472 (1988).
- “High k gate dielectrics Gd_2O_3 and Y_2O_3 for Si”, J. Kwo*, M. Hong, A.R. Kortan, K. T. Queeney, Y. J. Chabal, J. P. Mannaerts, T. Boone, J. J. Krajewski, A. M. Sergent, and J. M. Rosamilia, *Appl. Phys. Lett.*, **77**, 130, (2000).
- “Epitaxial Cubic Gd_2O_3 as a Dielectric for GaAs Passivation”, M. Hong, J. Kwo, A. R. Kortan, J. P. Mannaerts, and A. M. Sergent, *Science*, **283**, 1897, (1999).
- “Observation of the Spin Hall Effect in Semiconductors”, Y. K. Kato, R. C. Myers, A. C. Gossard, D. D. Awschalom*, *Science* **306**, 1910 (2004).
- “Tunnel field-effect transistors as energy-efficient electronic switches”, A. M. Ionescu, and H. Riel, *Nature*, **479**, 329 (2011).
